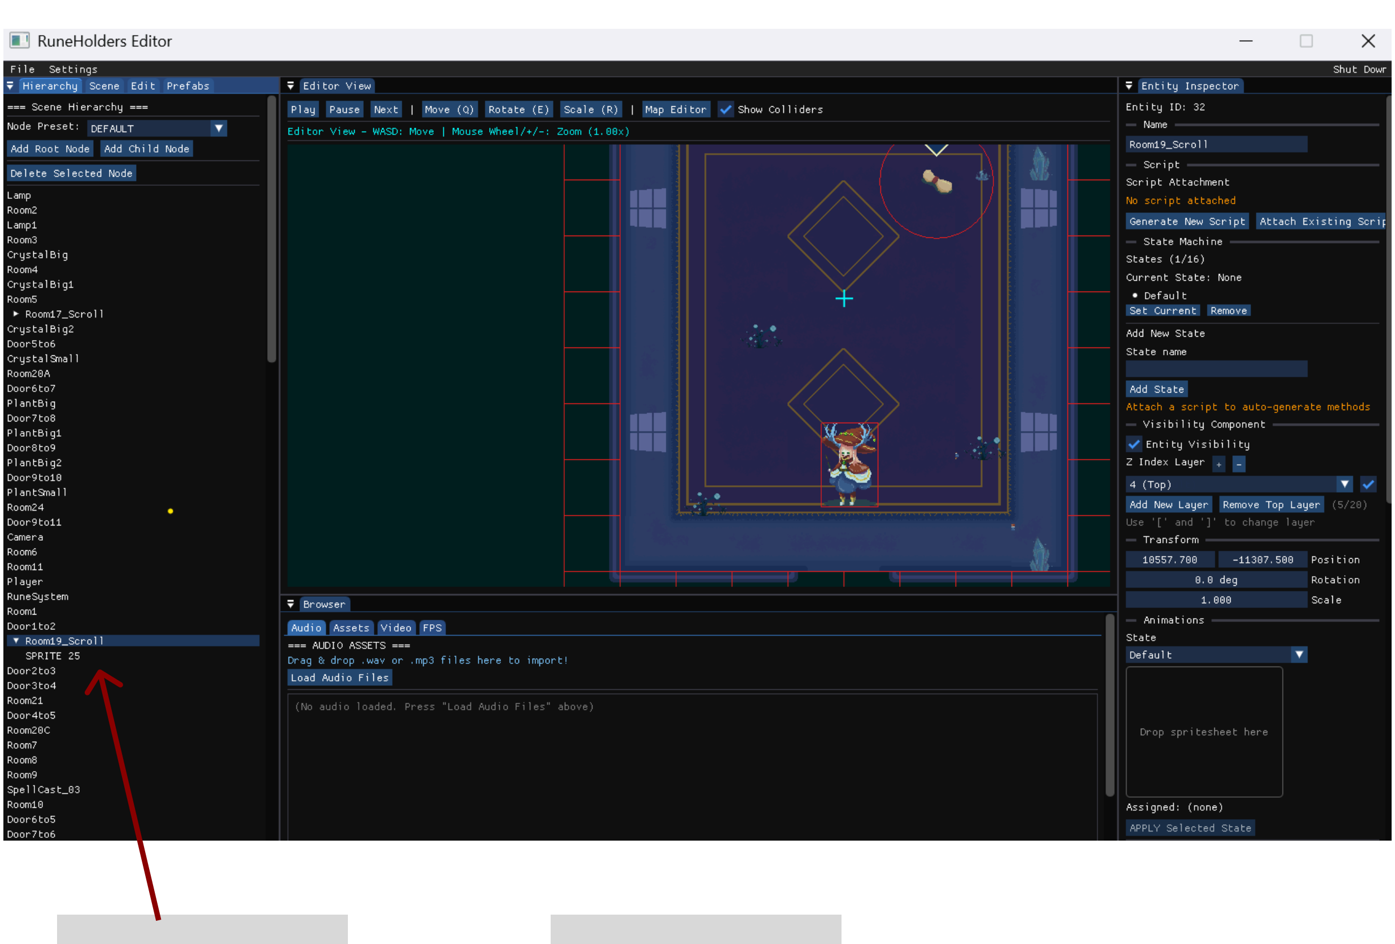
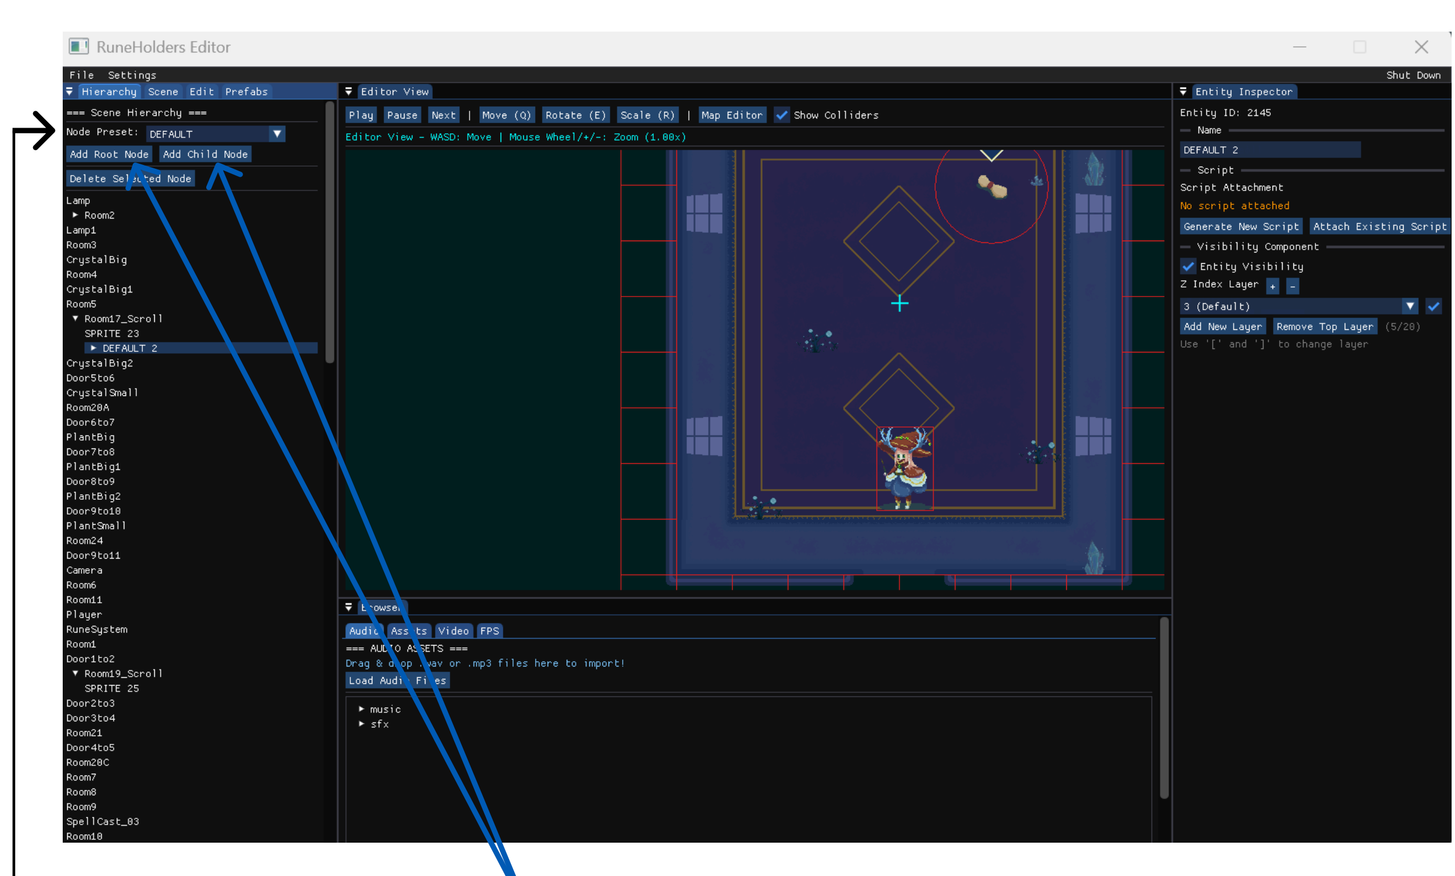
Nodes + Tilemap



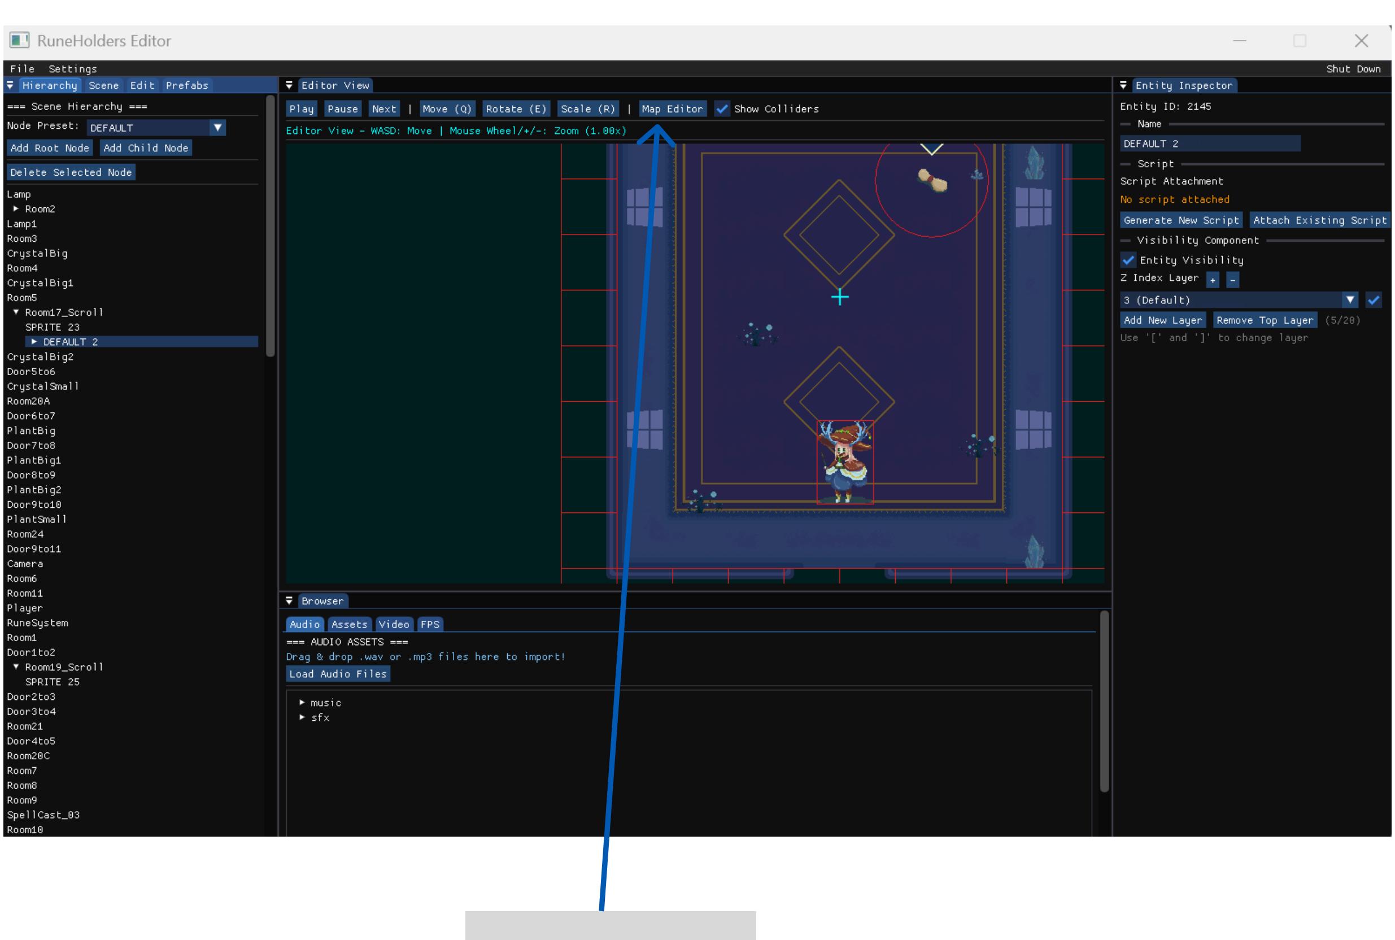
Parent Nodes are indicated with the → icon, and you can click on the icon to expand and view its children

All Nodes within the current scene will appear here, and they can be selected to be inspected

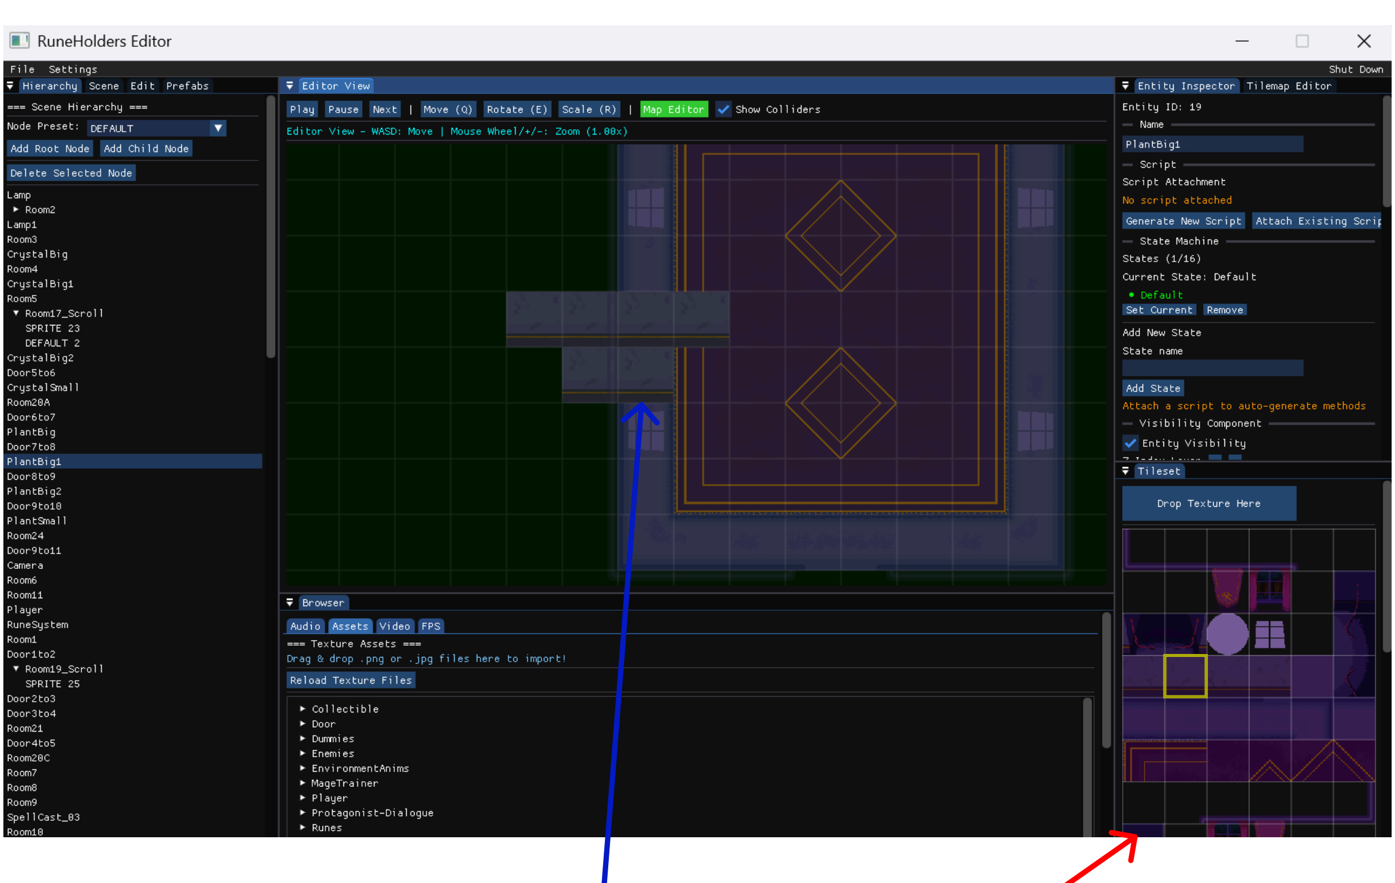


Each node is defined by a preset of components, select these presets here

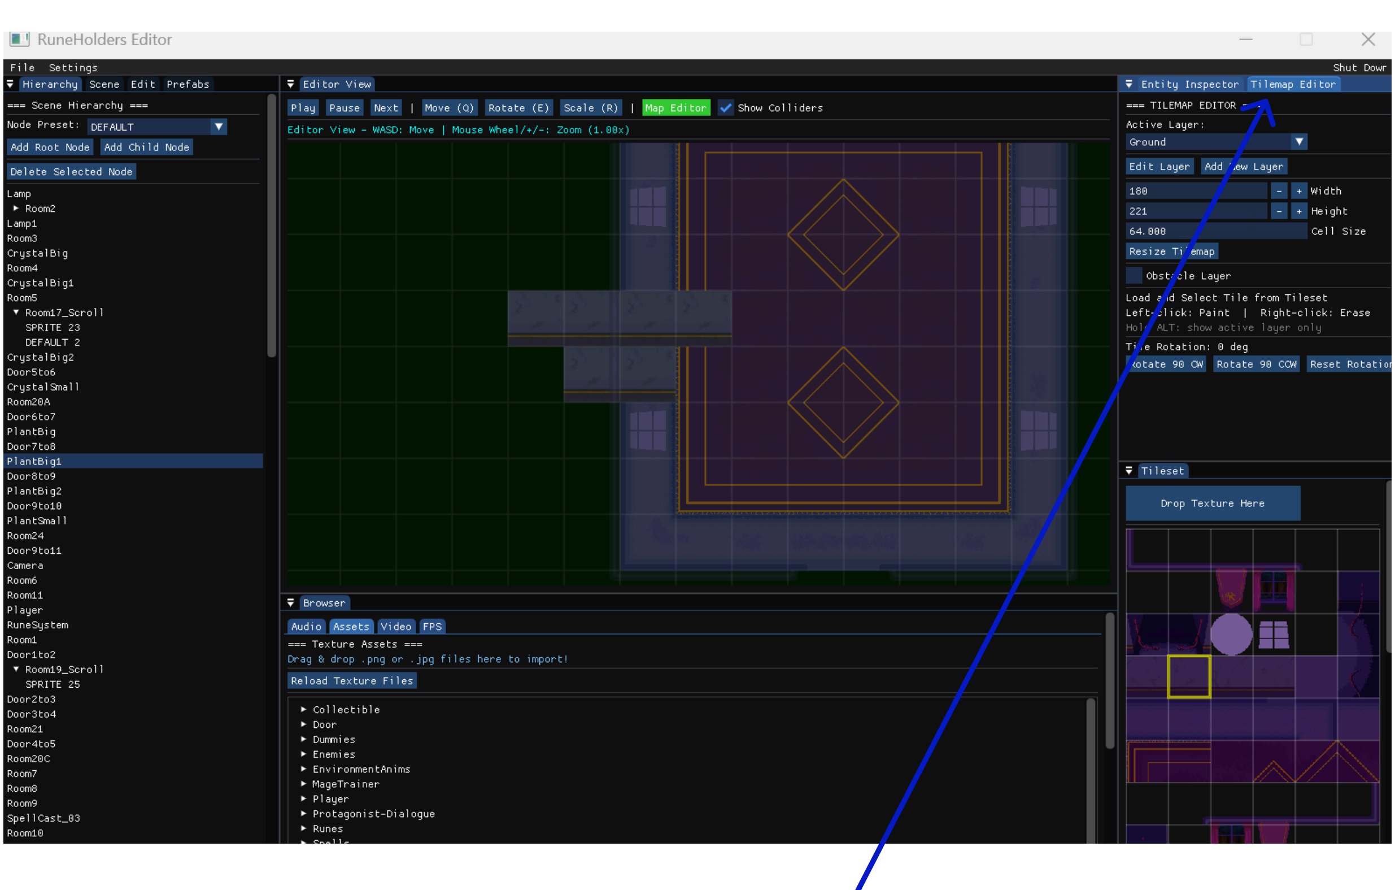
And you may create a node after (Adding a child node will nest it under another node with →)



The Tilemap editor can be opened up here

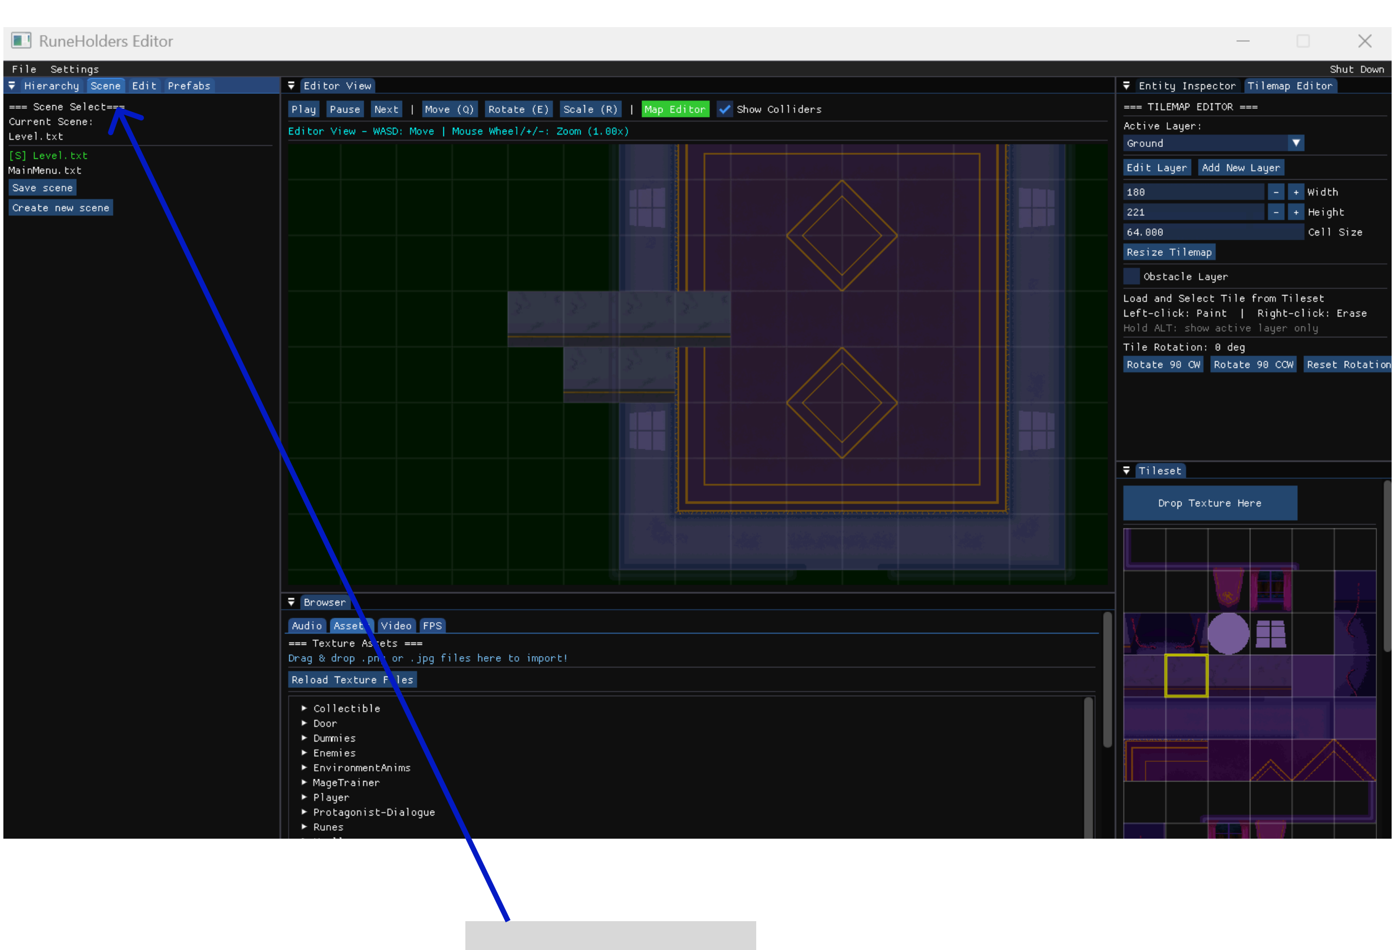


Individual tiles can be painted on the scene directly, and each tile can be selected here



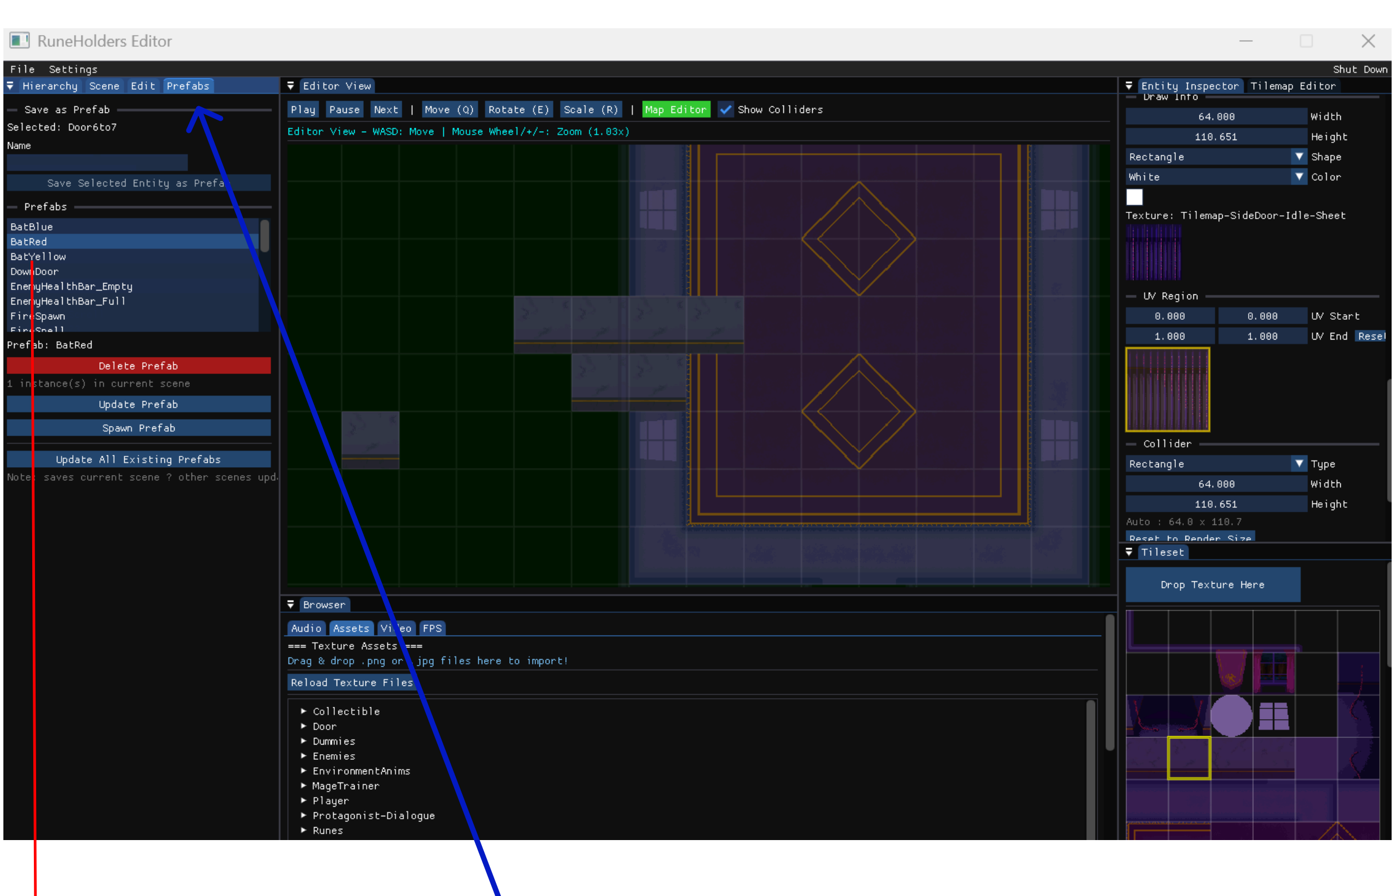
Additional Tilemap configurations (such as resizing tiles) can be found under this tab

Scenes



After clicking on the Scenes tab here, new scenes can be created, along with saving scenes

Prefabs



Prefabs are found under the Prefab tab here

Prefabs can be created, updated, or deleted here.

Various options here are tied in to the entities selected in the hierarchy

If we use "Update Prefab", it will update the chosen prefab, based on the entity selected in the hierarchy

E.g here, we select BatRed. BatRed will be adapted to the entity selected in the hierarchy, which is Door6to7

After which, we can spawn the updated prefab via "Spawn Prefab".
