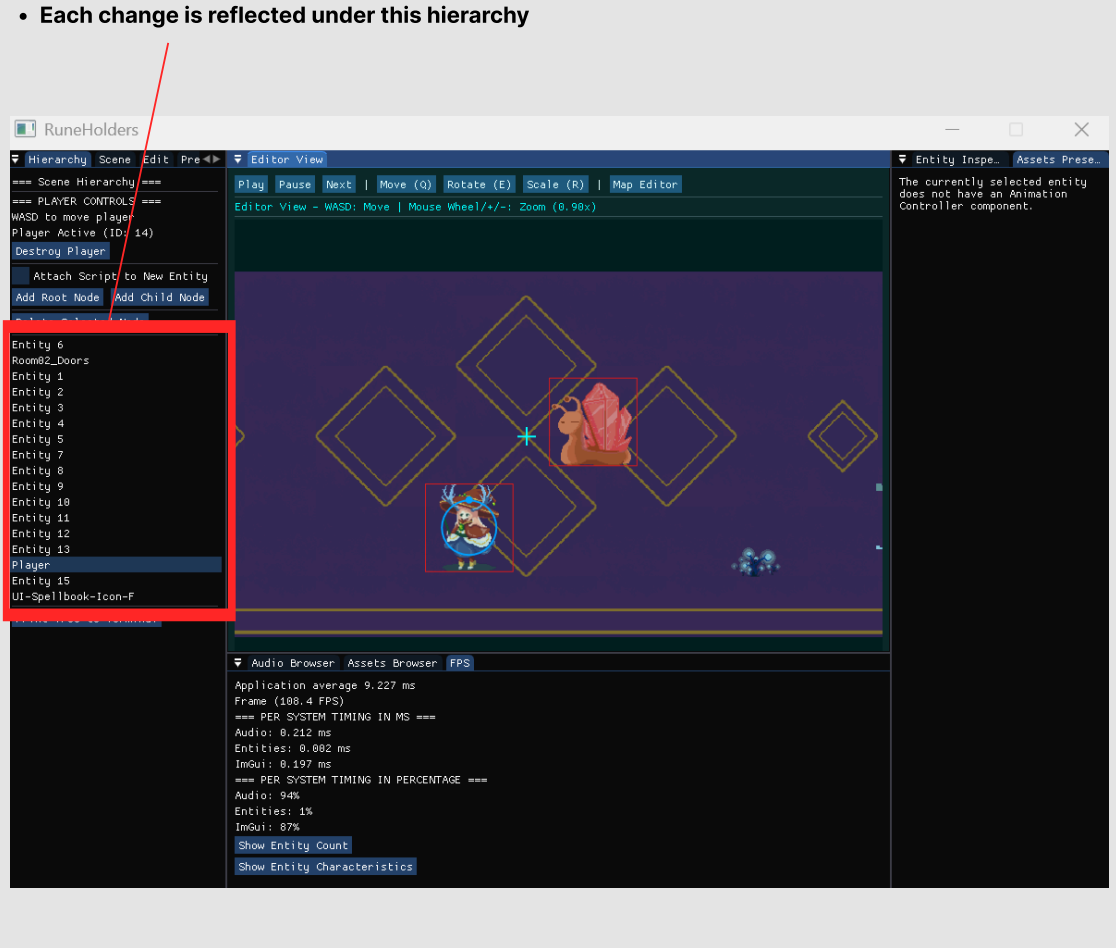
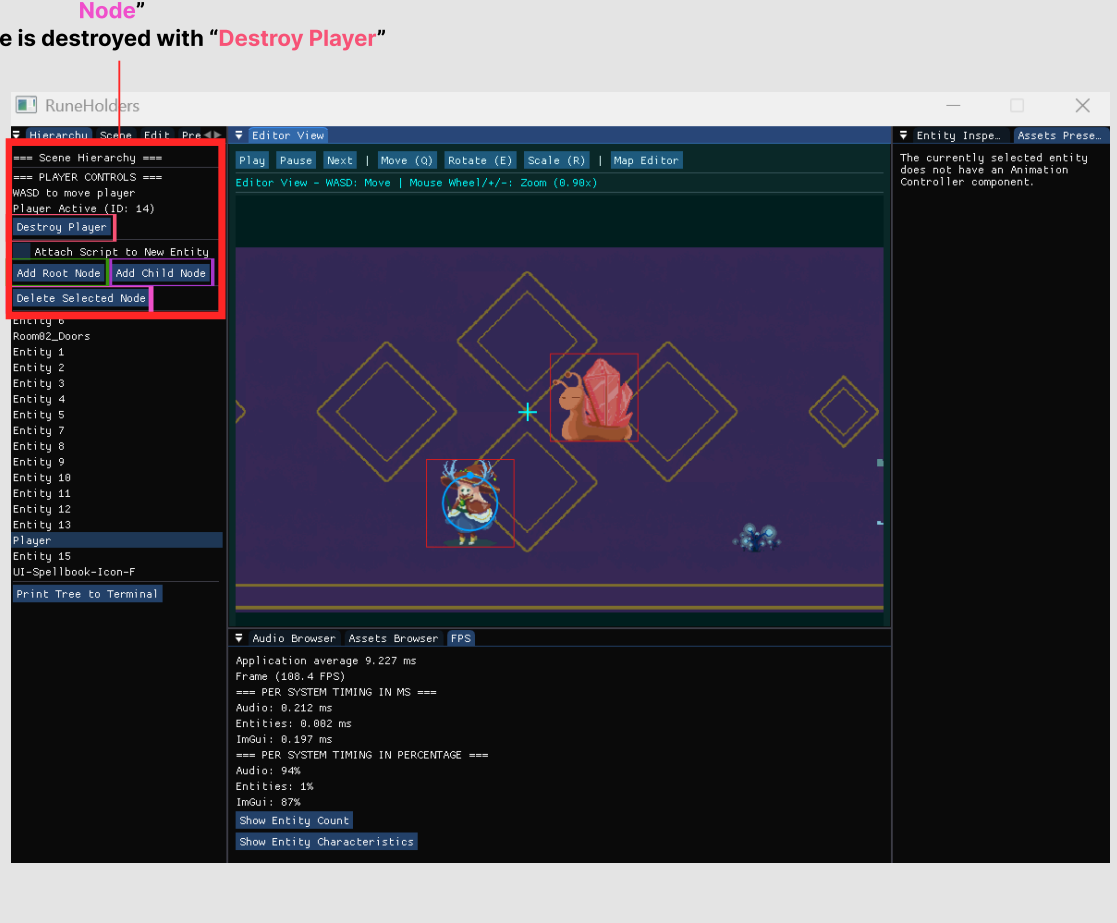
Editor Guide

Scene Hierarchy

- This is where all nodes within the scene are displayed
- Each node can be nested under another node or destroyed
- Each change is reflected under this hierarchy

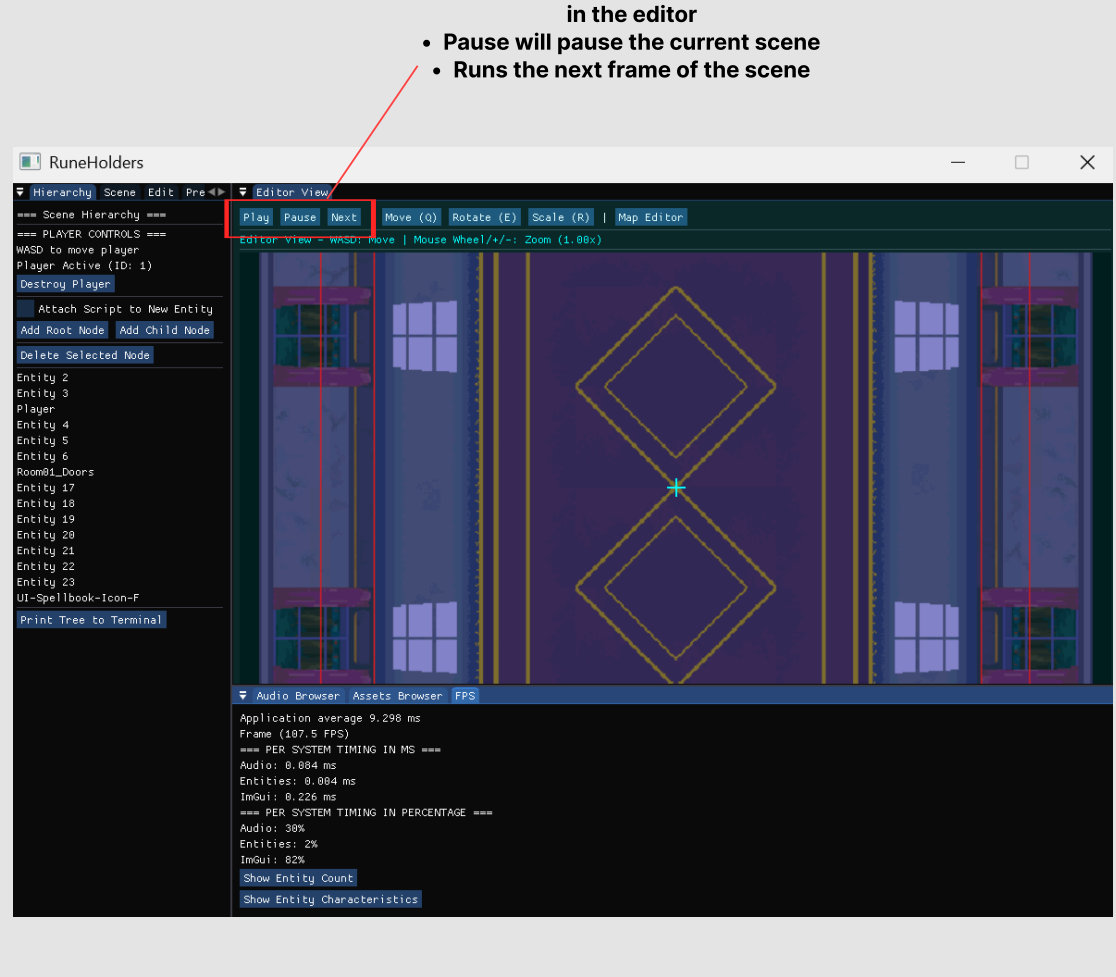


- Nodes can be added from here using the buttons "Add Root Node" and "Add Child Node".
- Nodes can also be destroyed with "Delete Selected Node"
- The Player node is destroyed with "Destroy Player"



Scene Manipulation

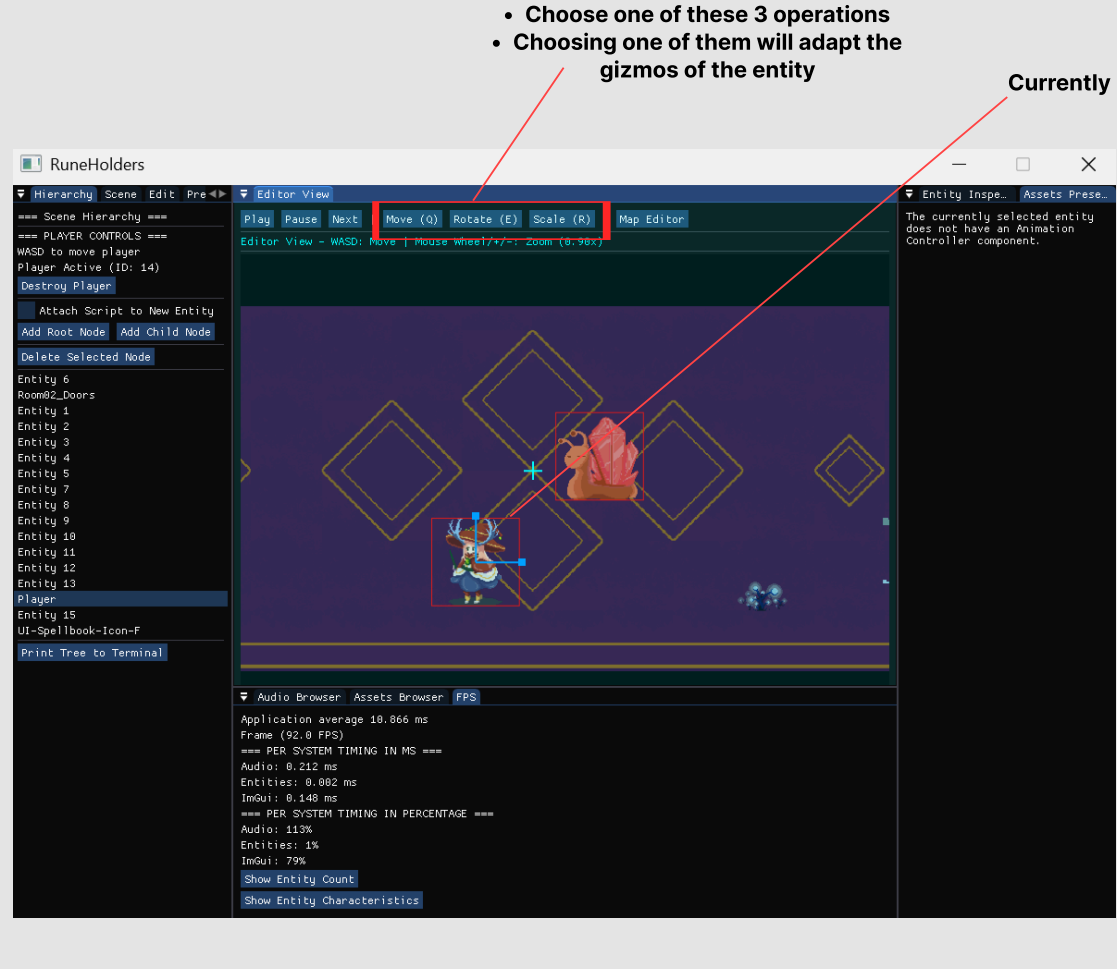
- Play will play the current scene selected in the editor
- Pause will pause the current scene
- Runs the next frame of the scene



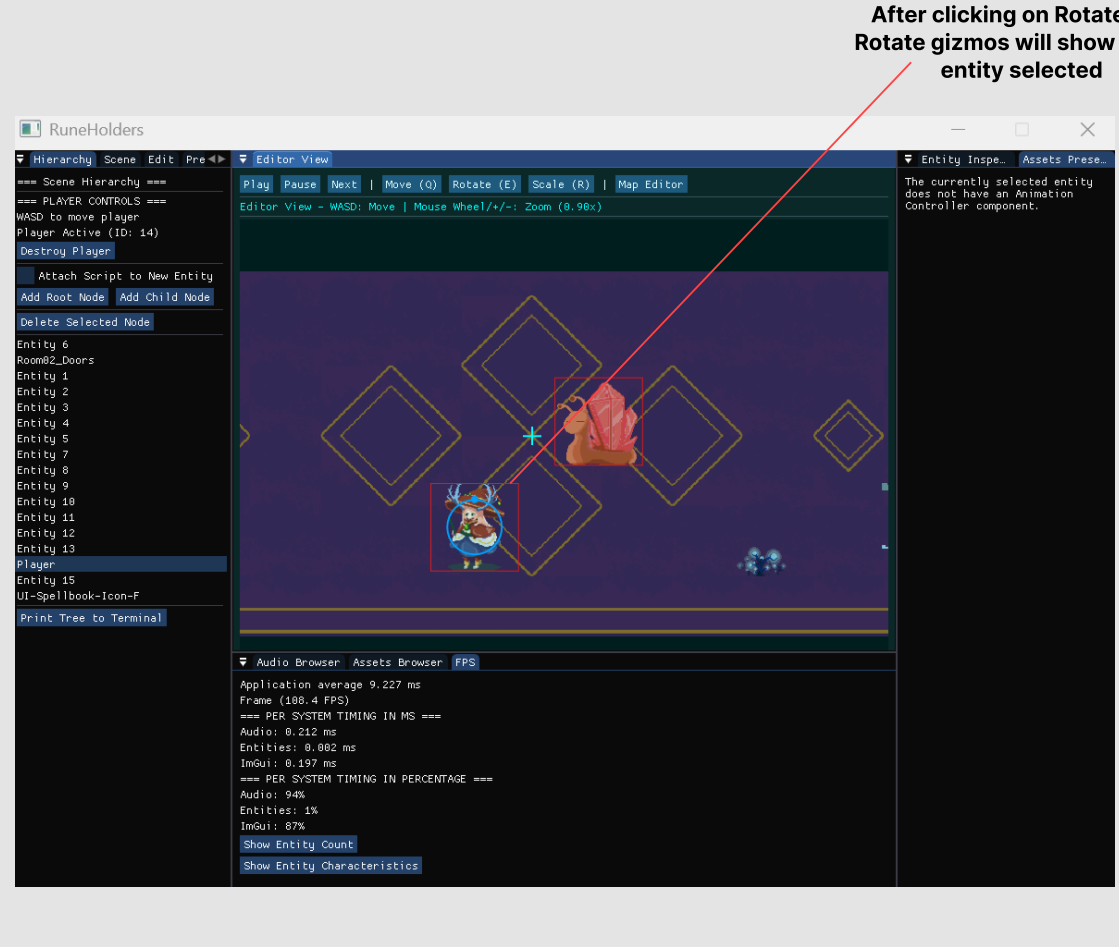
Node Manipulation

Node Manipulation
- Select on a node
- Choose one of these 3 operations
- Choosing one of them will adapt the gizmos of the entity

Currently Move is selected



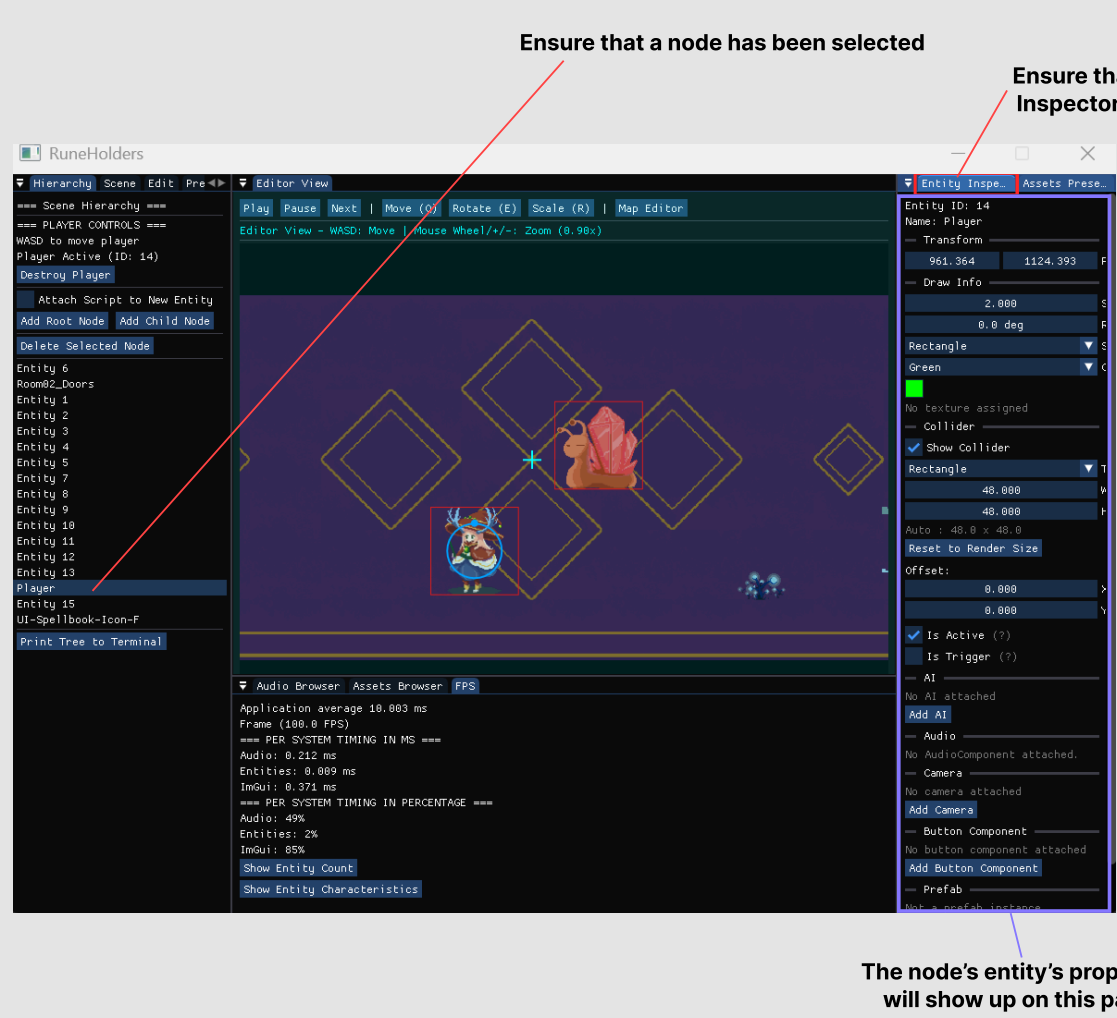
After clicking on Rotate, the Rotate gizmos will show on the entity selected



Inspecting Nodes

Ensure that a node has been selected

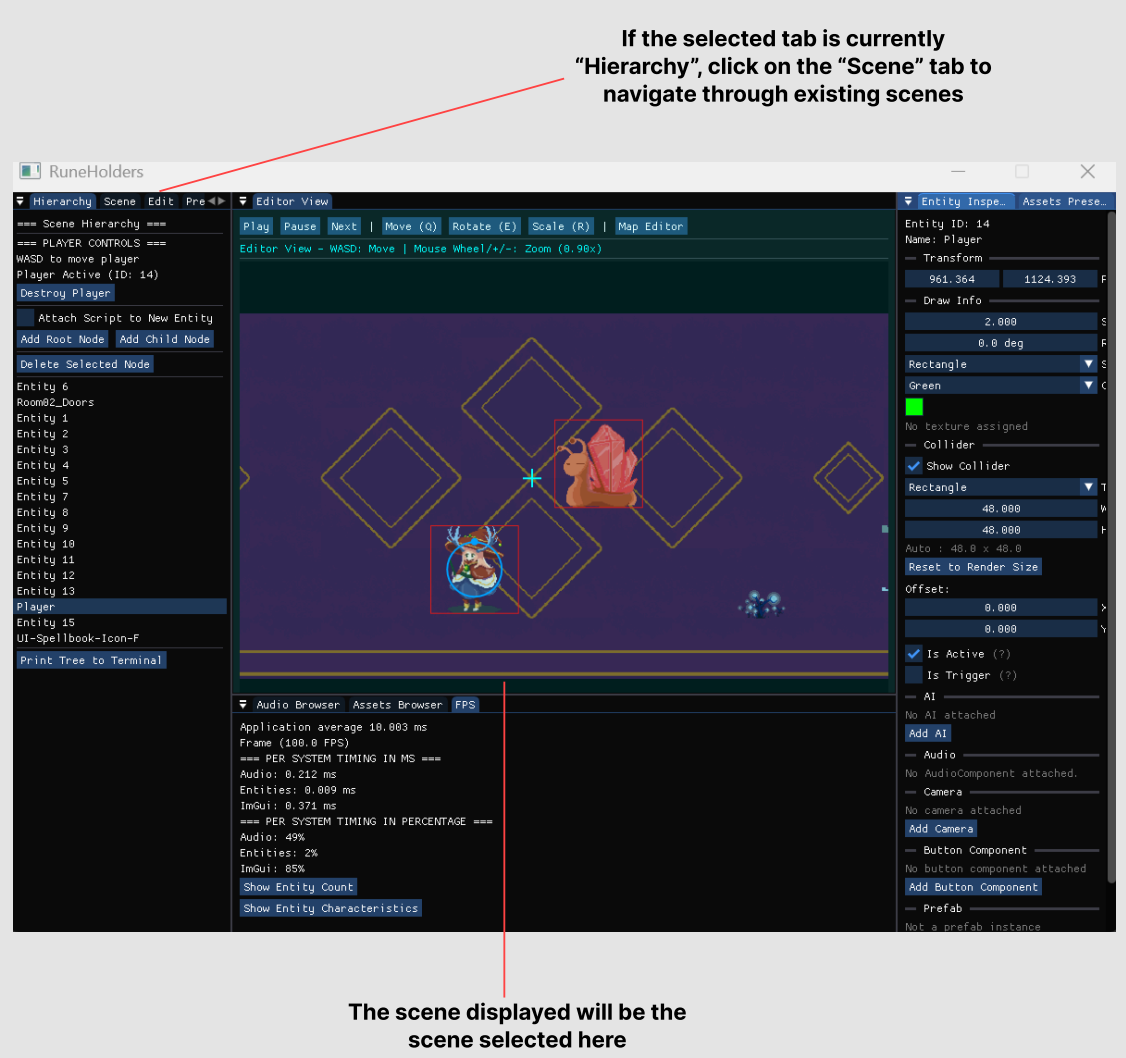
Ensure that the Entity Inspector is selected



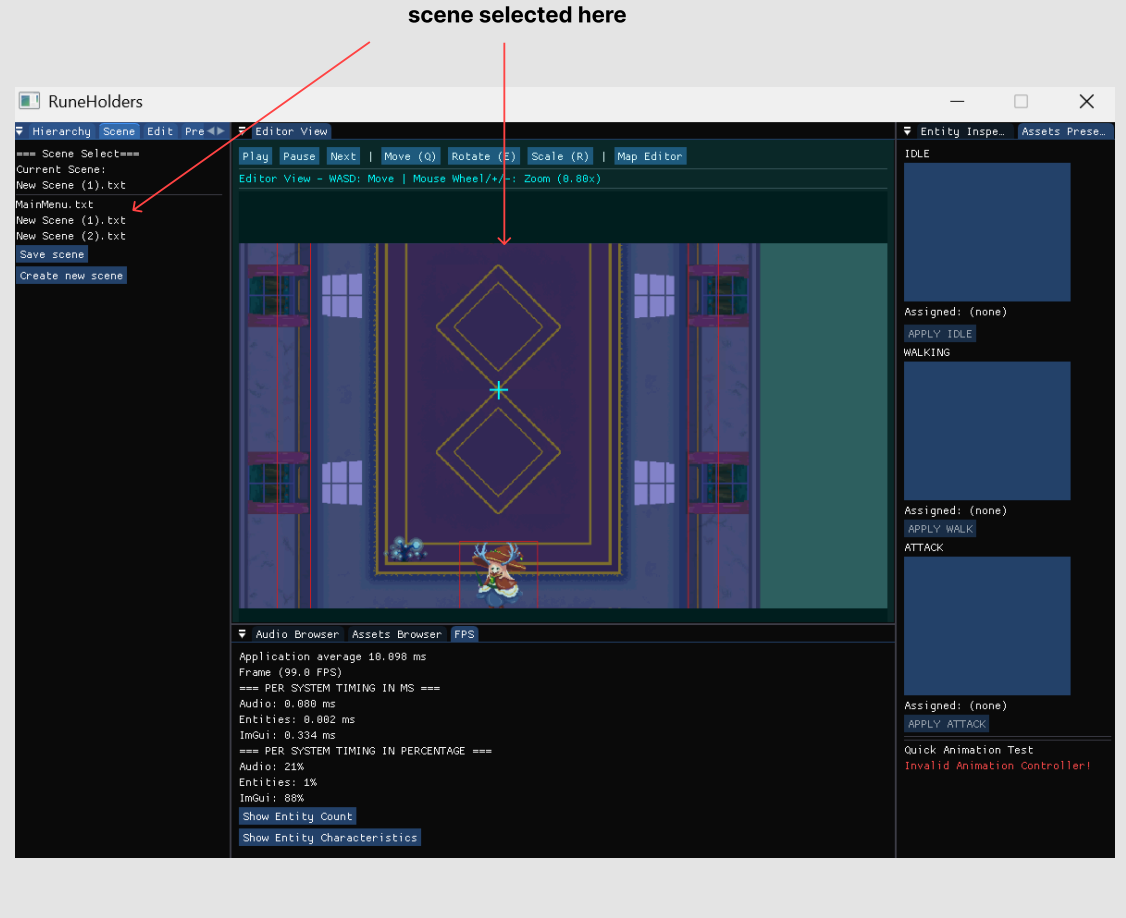
The node's entity's properties will show up on this panel

Switching Scenes

If the selected tab is currently "Hierarchy", click on the "Scene" tab to navigate through existing scenes

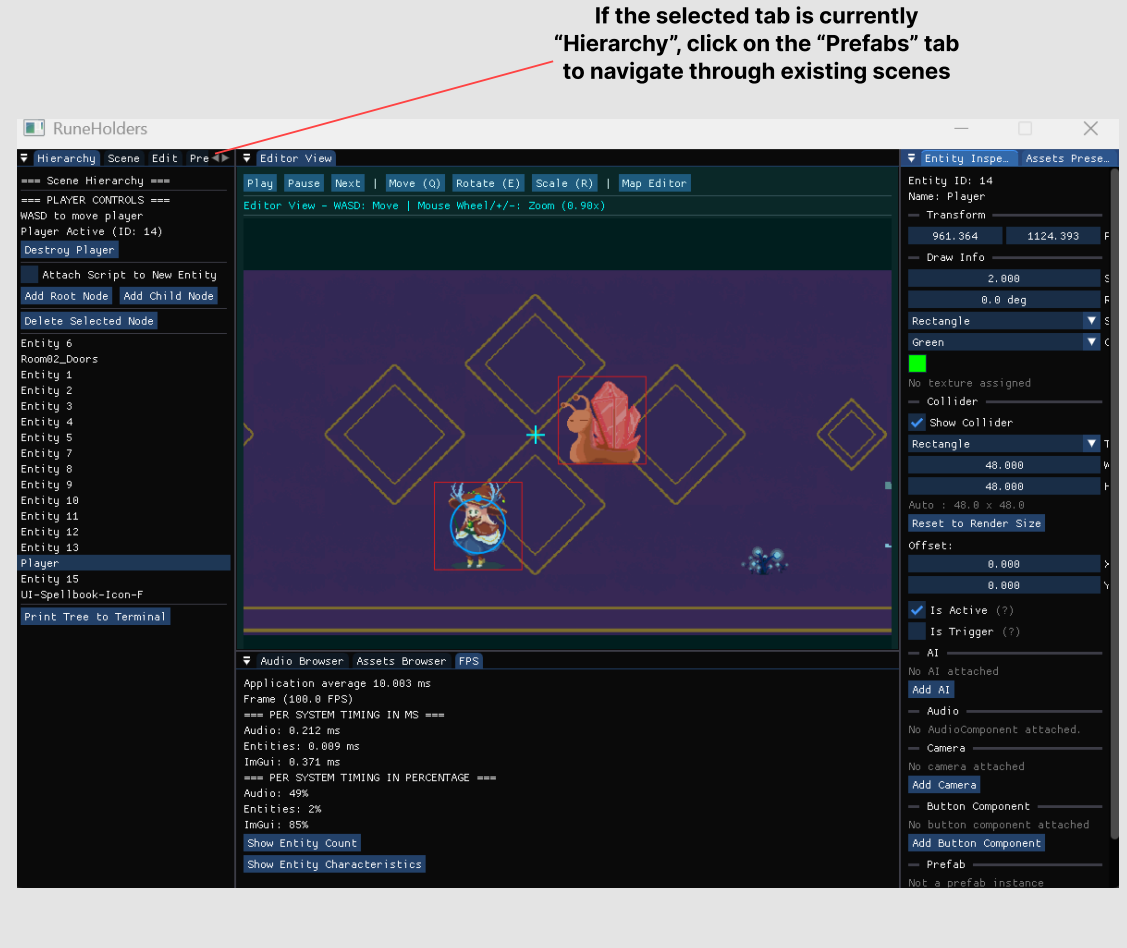


The scene displayed will be the scene selected here

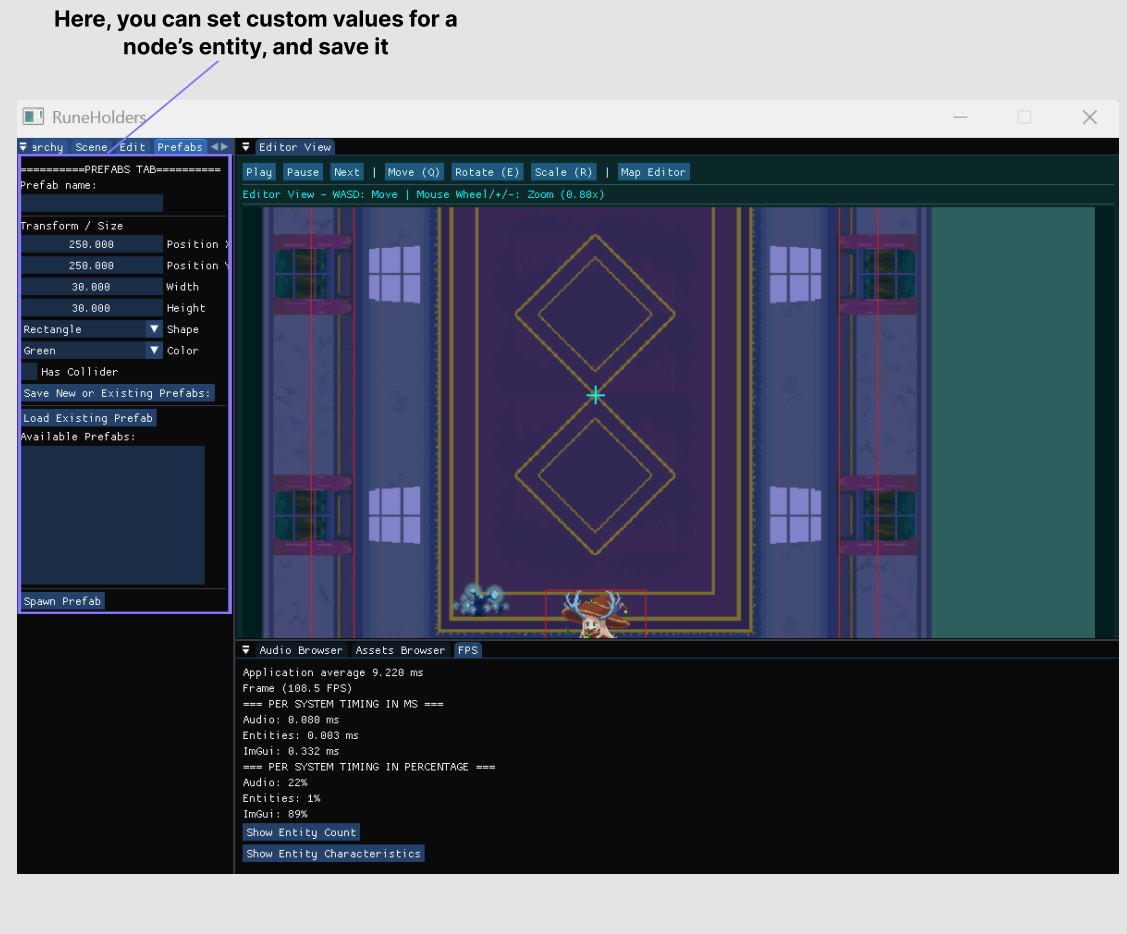


Creating a Prefab

If the selected tab is currently "Hierarchy", click on the "Prefabs" tab to navigate through existing scenes



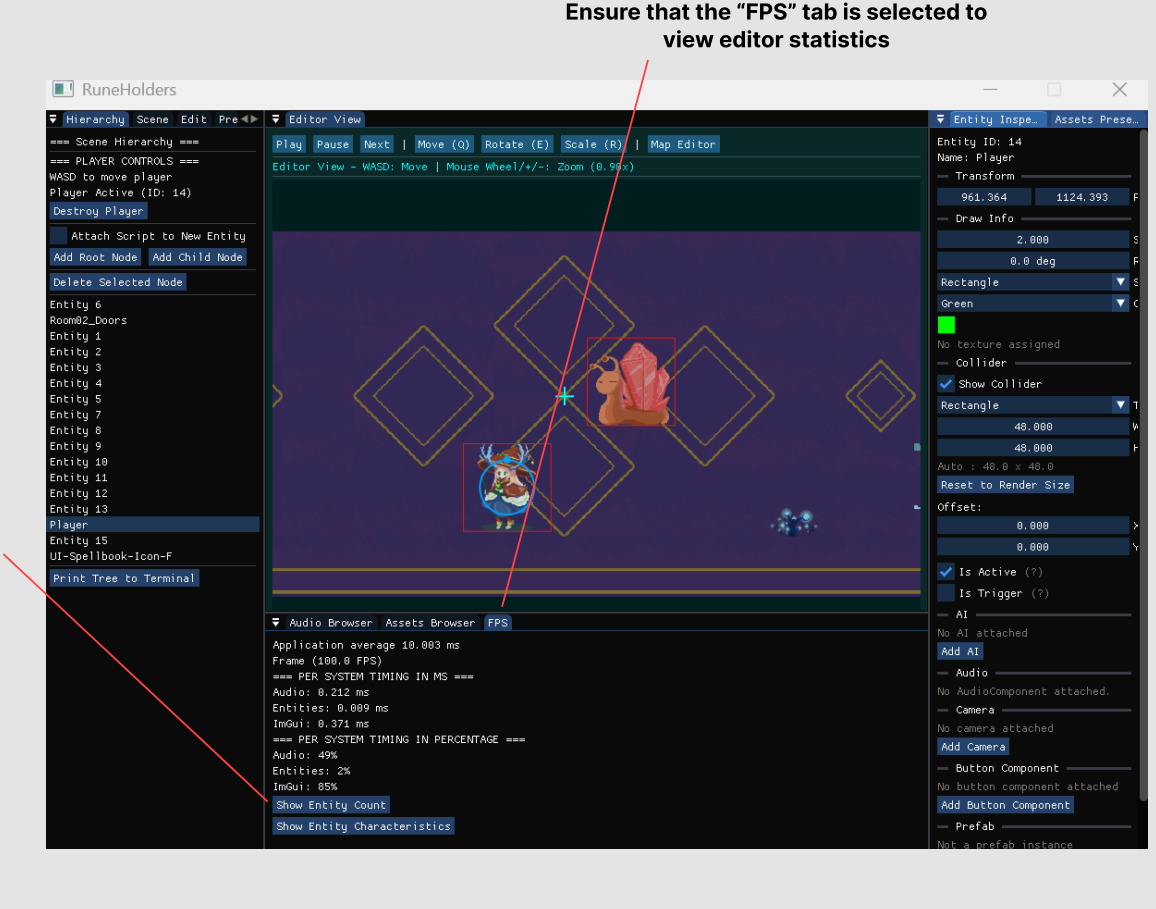
Here, you can set custom values for a node's entity, and save it



FPS

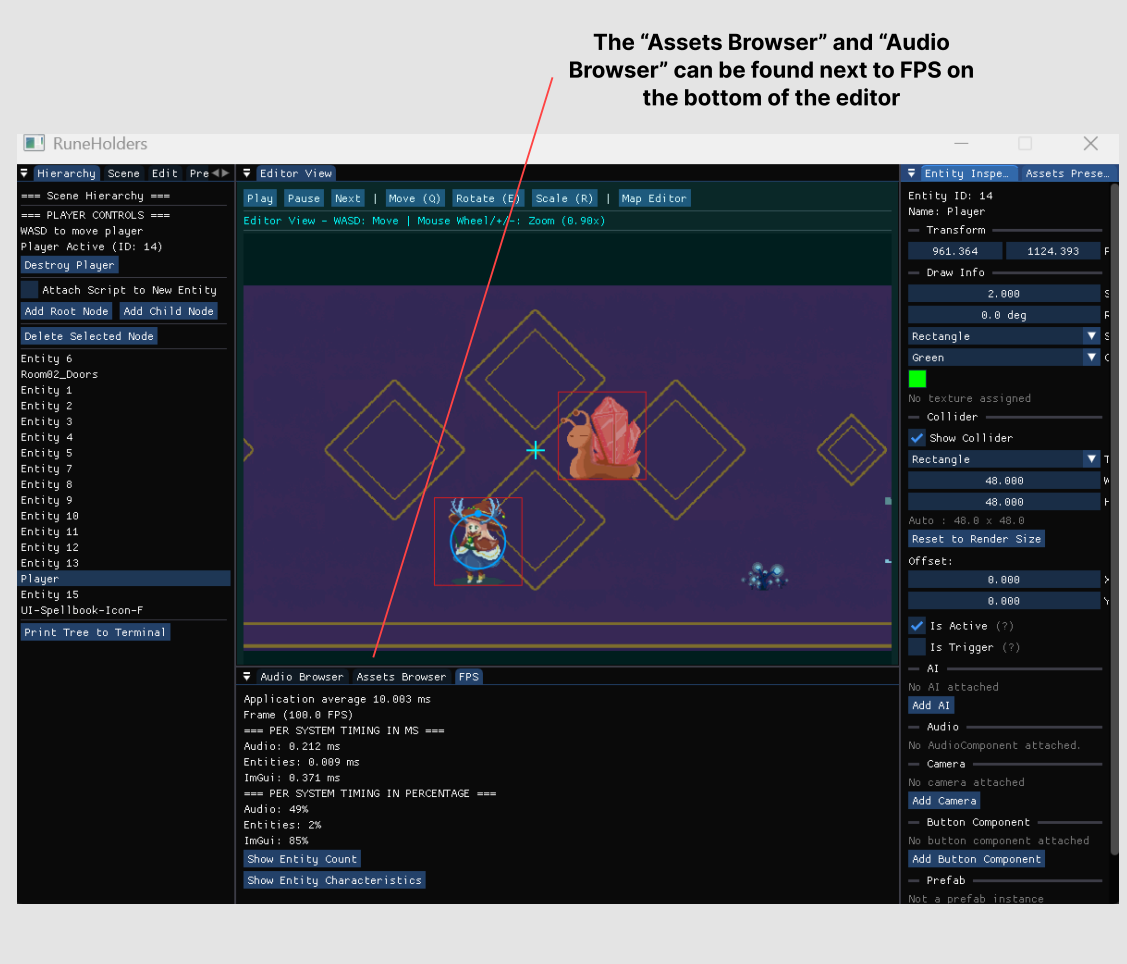
Ensure that the "FPS" tab is selected to view editor statistics

Additional Entity statistics are displayed here!

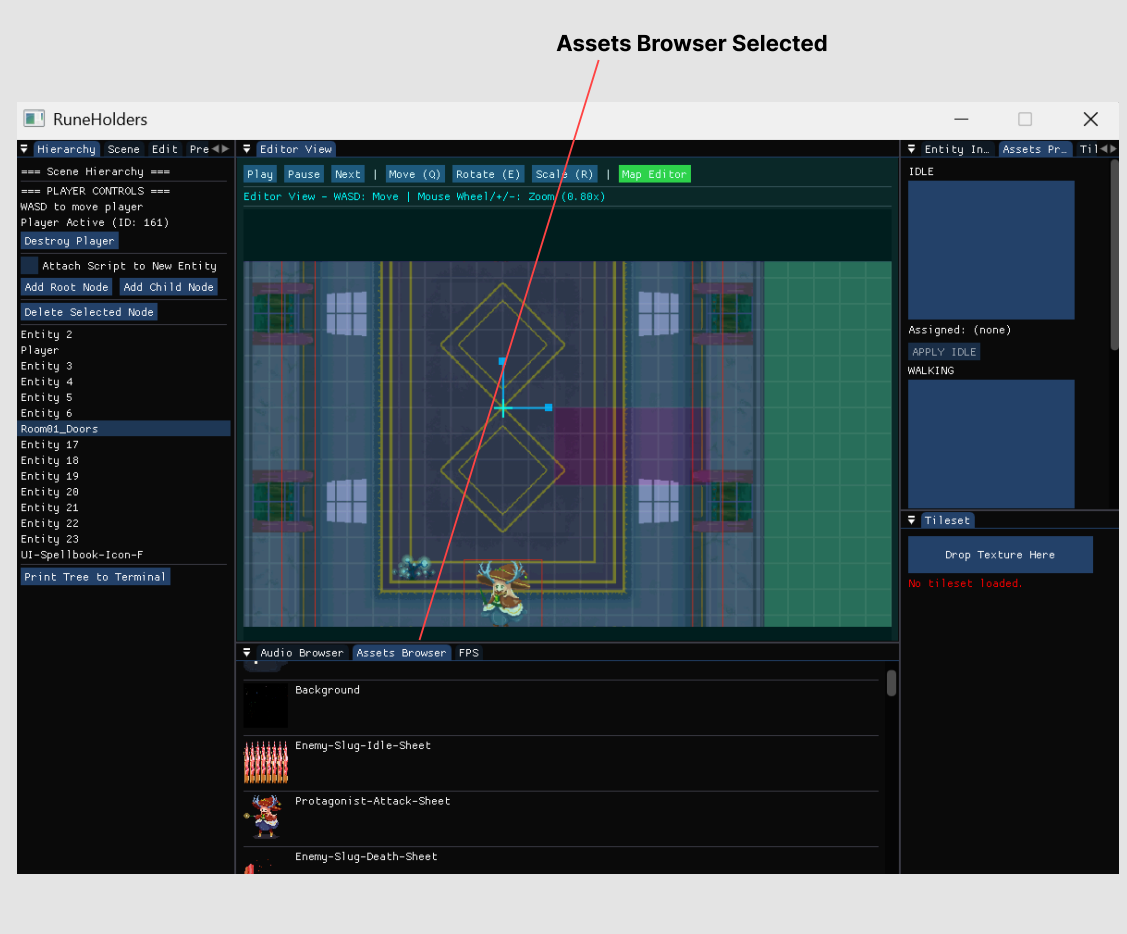


Assets and Audio Browsers

The "Assets Browser" and "Audio Browser" can be found next to FPS on the bottom of the editor

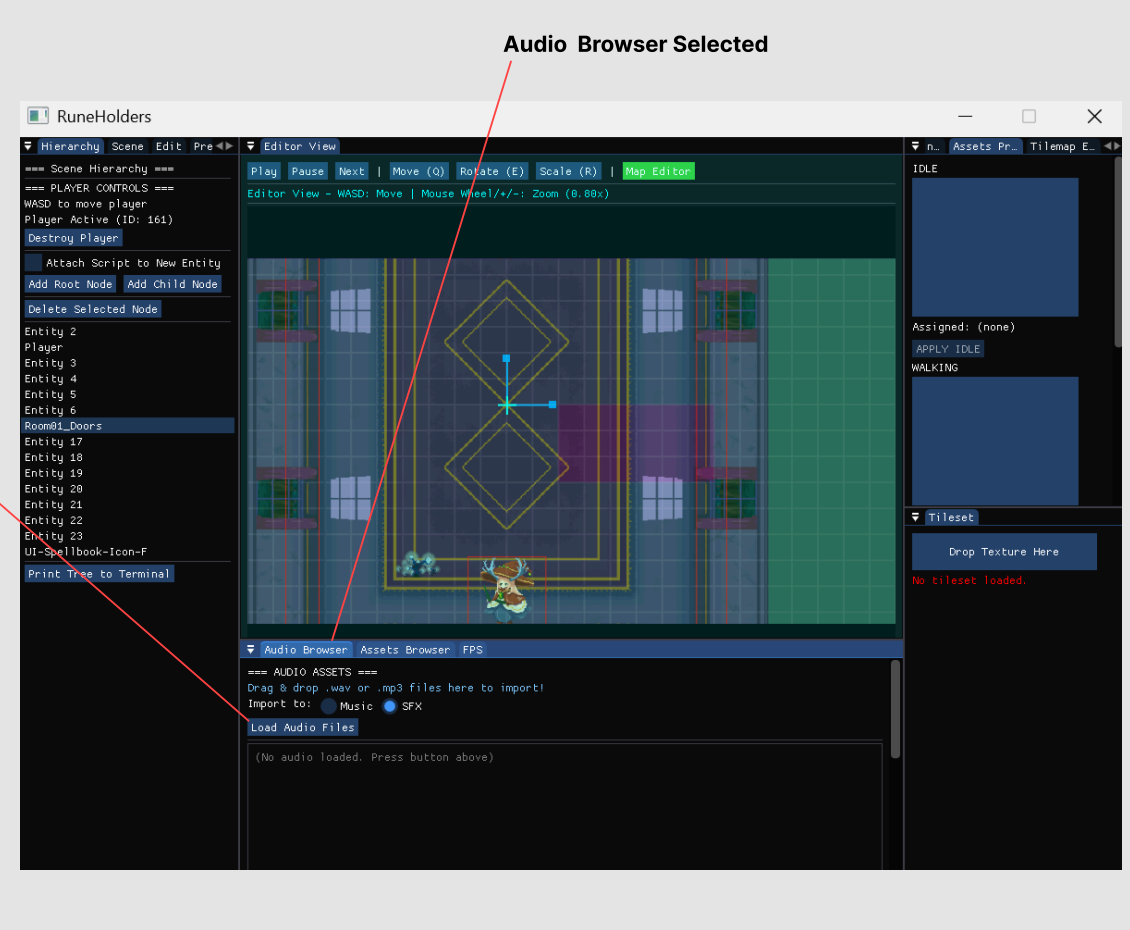


Assets Browser Selected



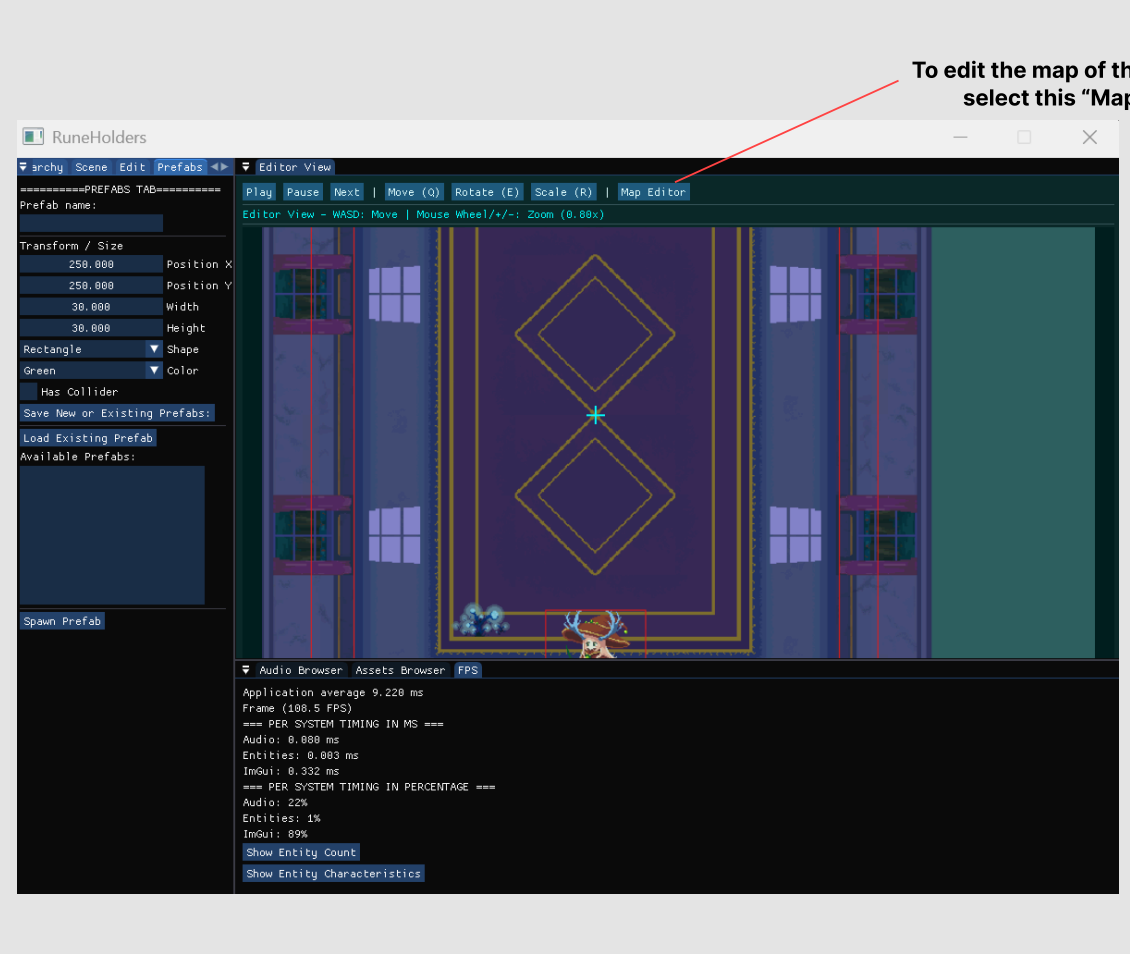
Audio Browser Selected

Load Audio files here



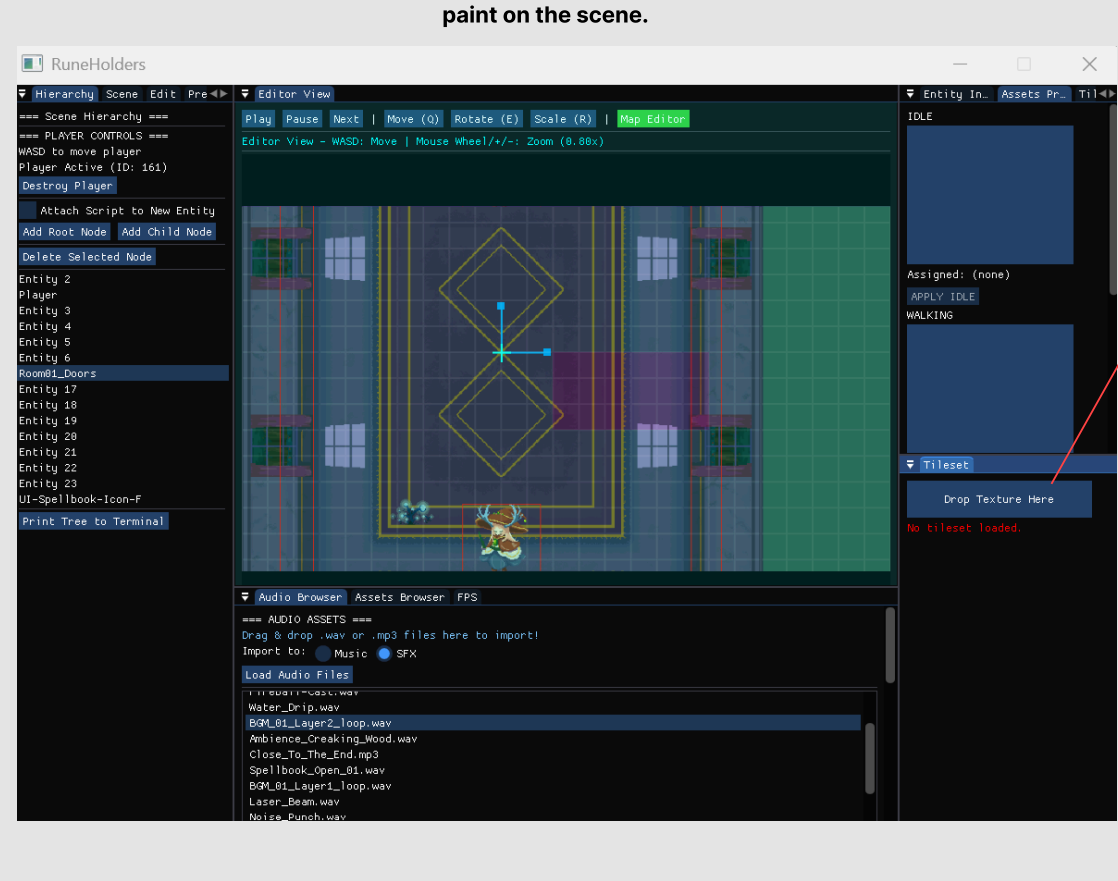
Map Editing

To edit the map of the current scene, select this "Map Editor" tab

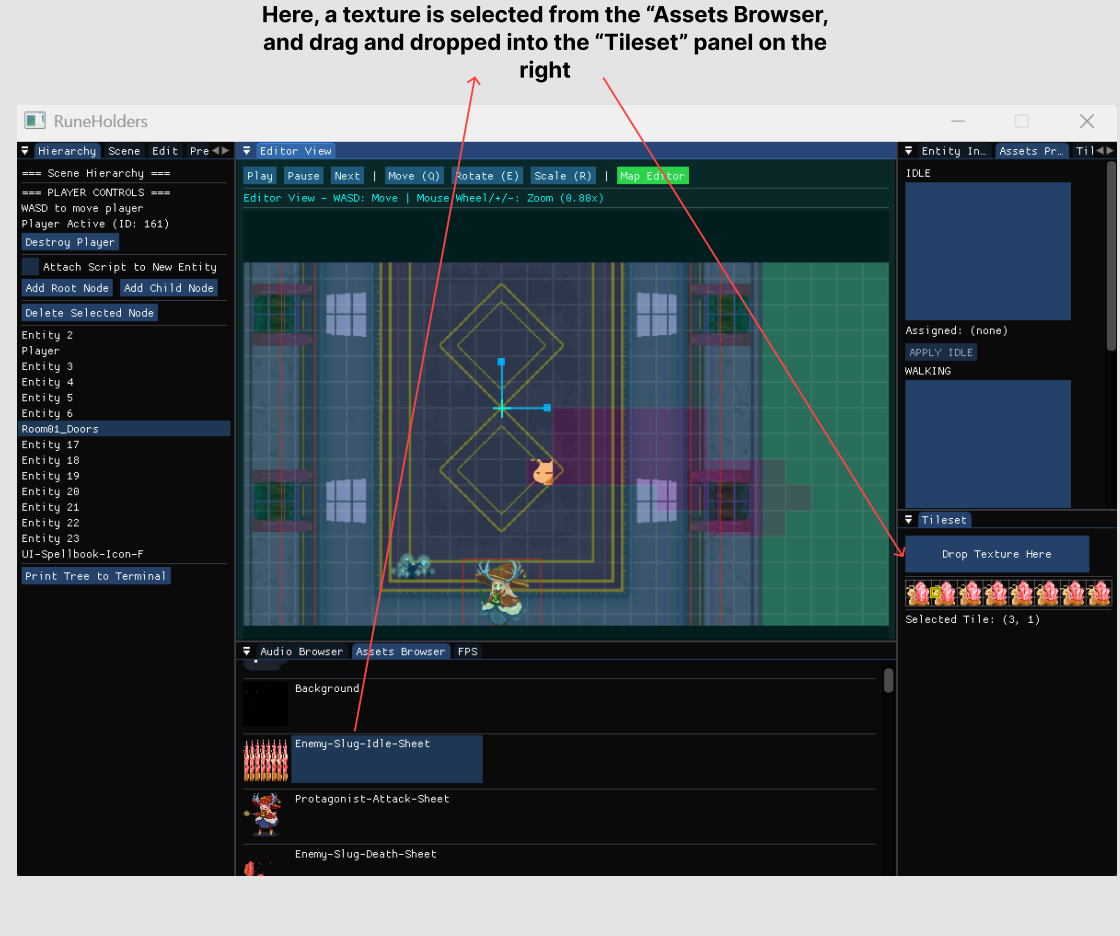


Upon selecting "Map Editor", the tilemap will be displayed and you can paint on the scene.

To paint a texture onto the map, drop a texture from the Assets Browser

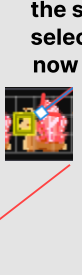


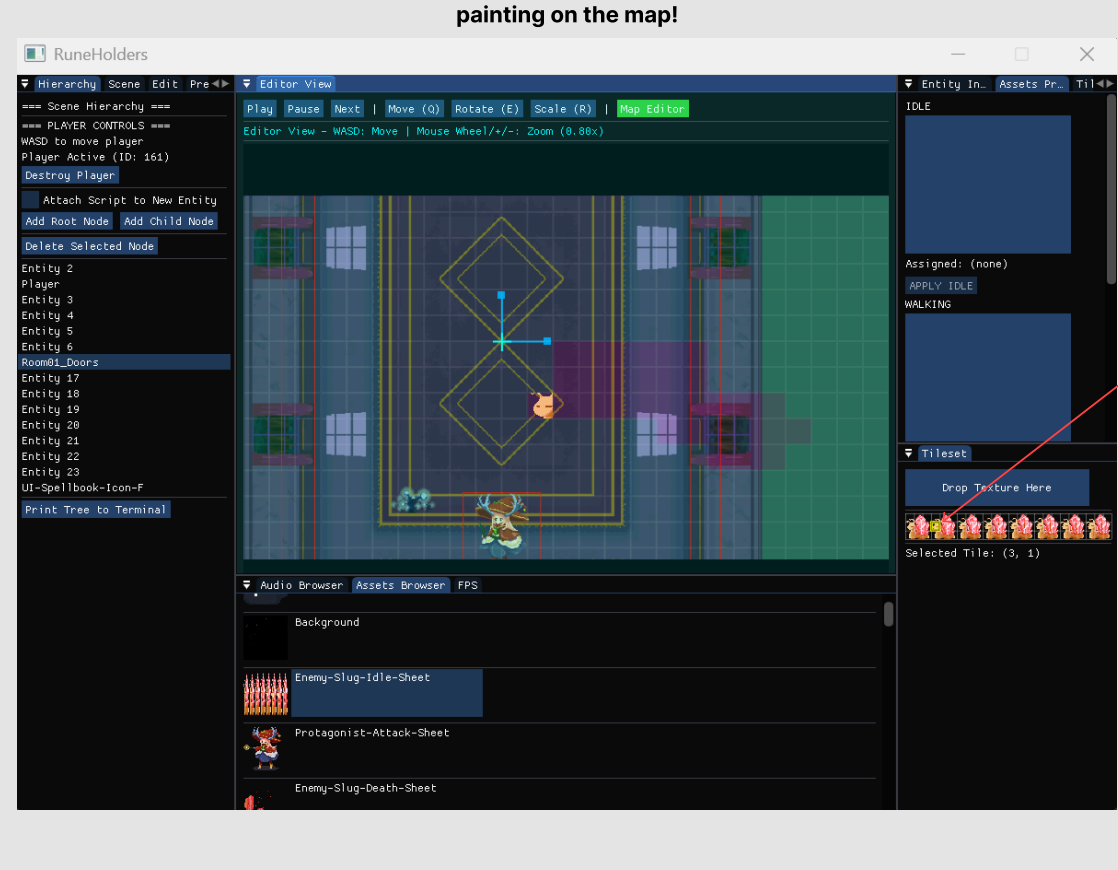
Here, a texture is selected from the "Assets Browser", and drag and dropped into the "Tileset" panel on the right

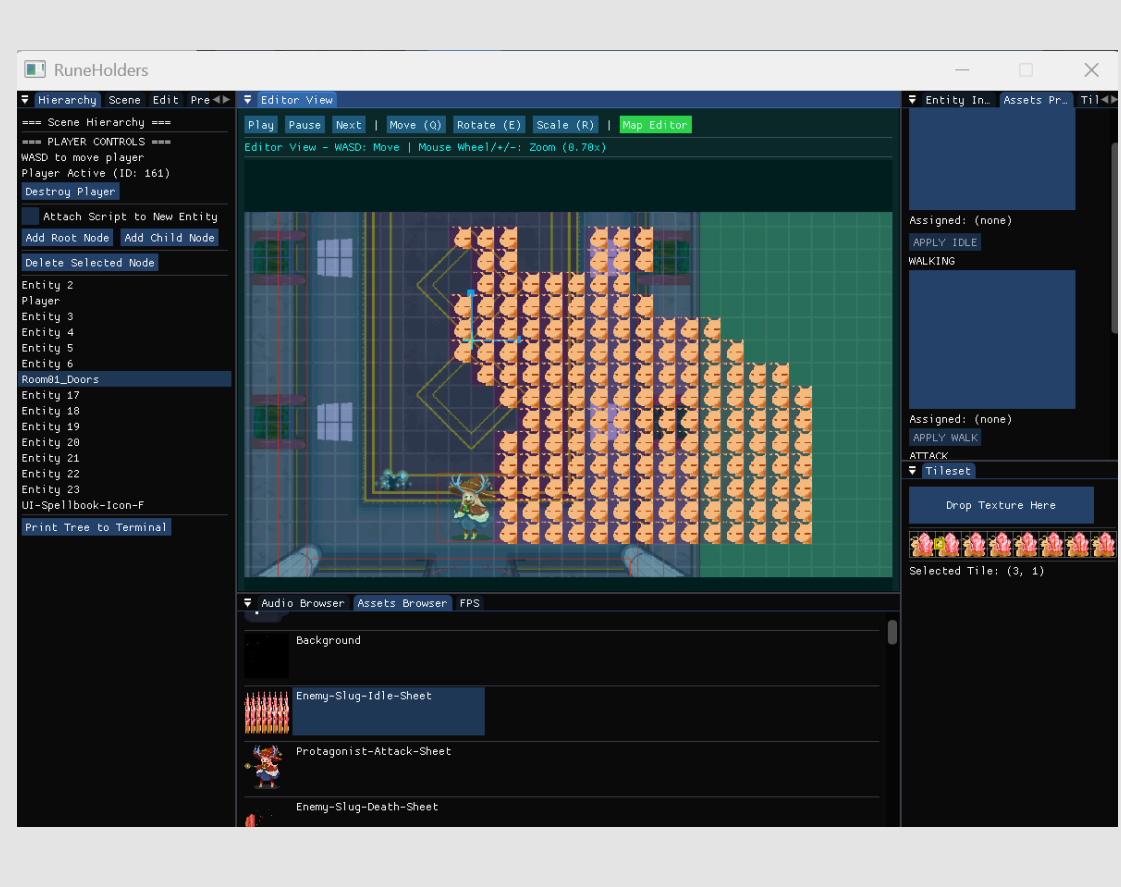


After a texture has been dragged in to the "Tileset" panel, select a texture on the "atlas" and start painting on the map!

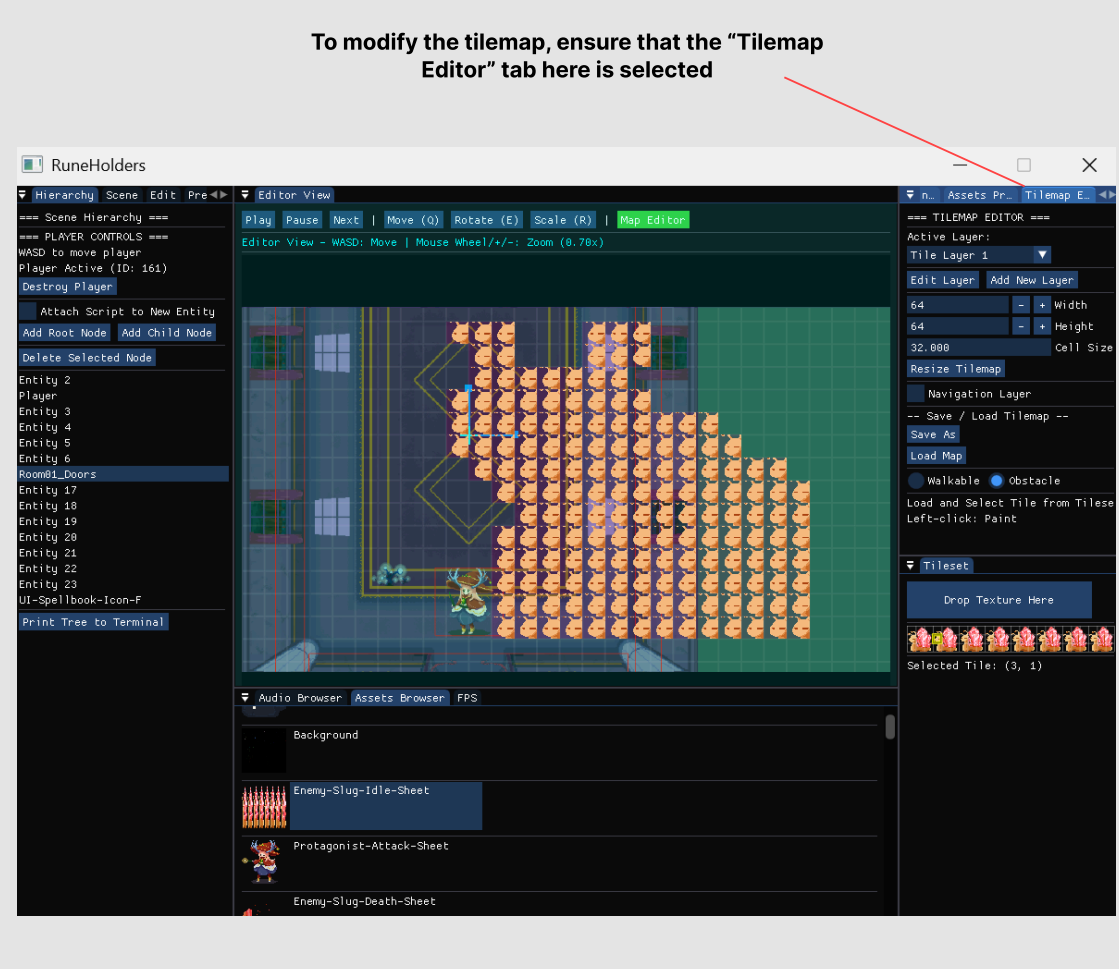
Here, the texture of the snail's face is selected. We can now paint on the map!





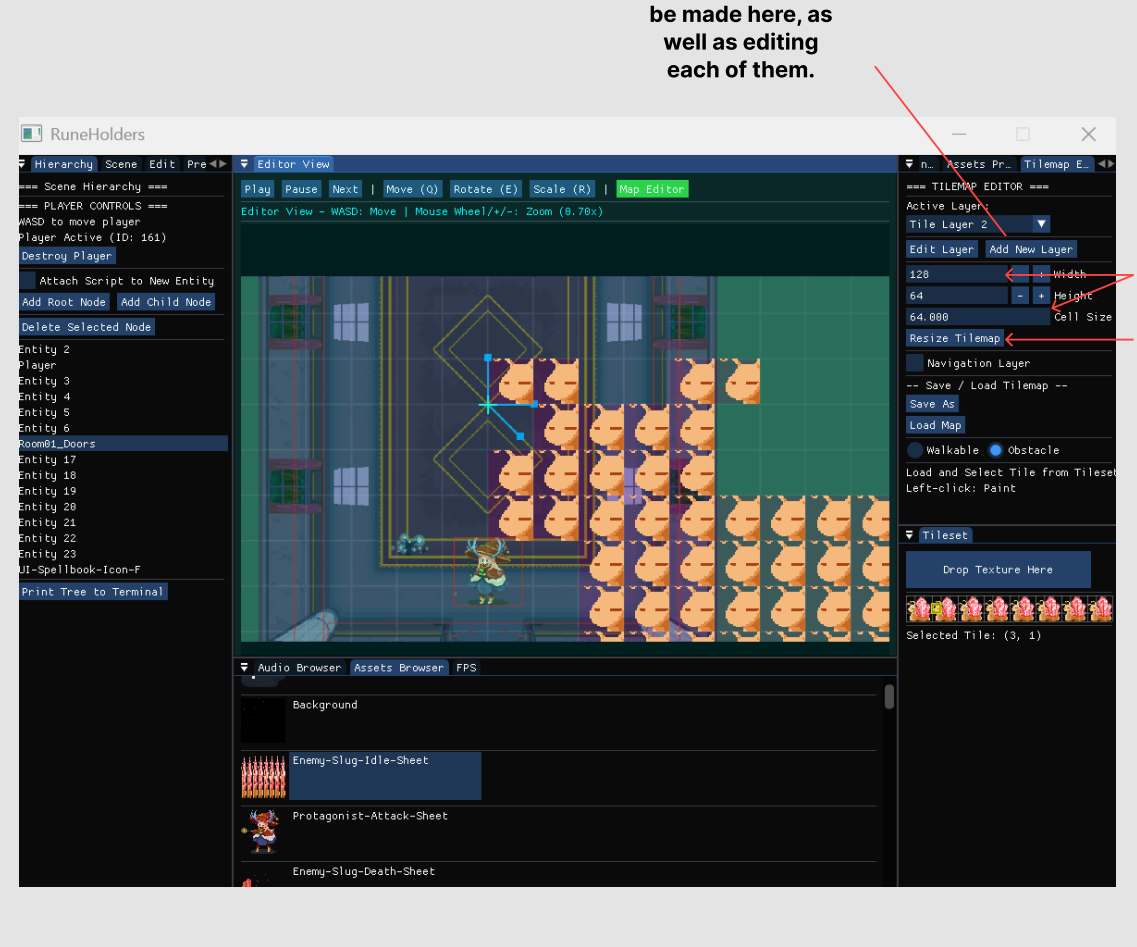


To modify the tilemap, ensure that the "Tilemap Editor" tab here is selected



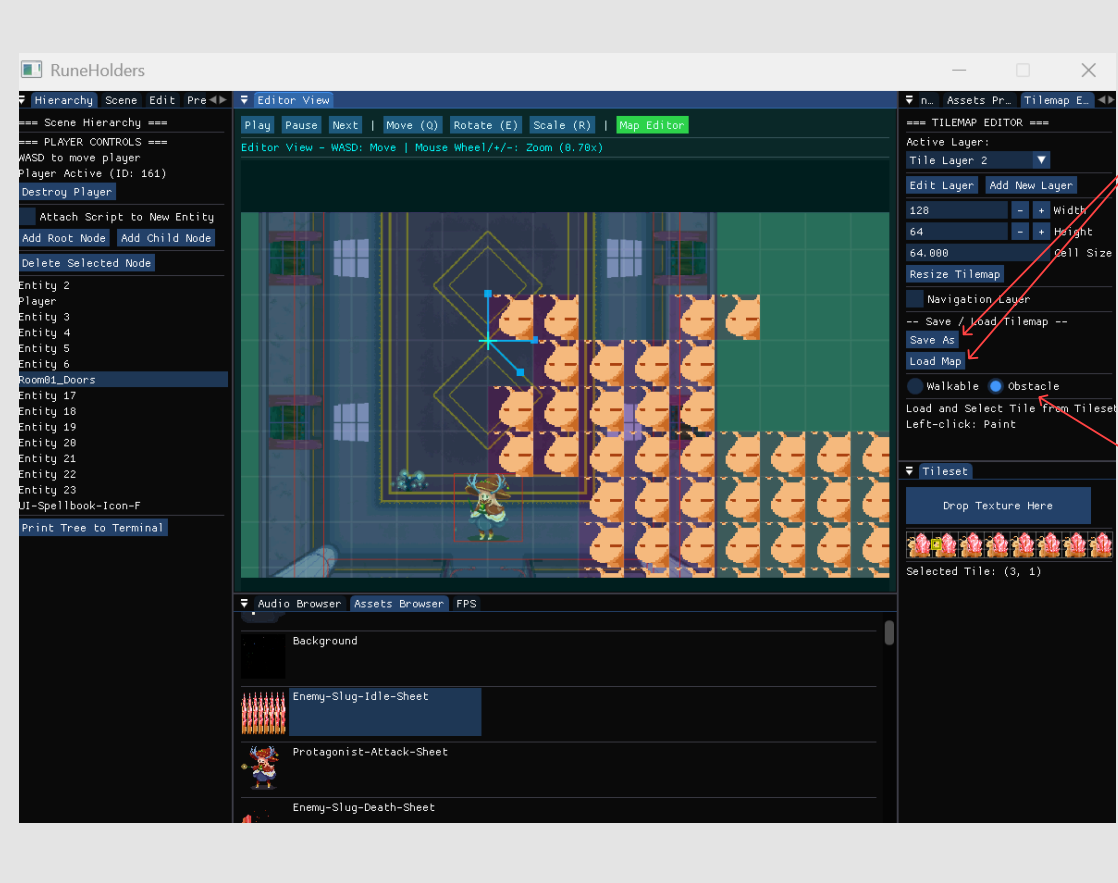
New Tile layers can be made here, as well as editing each of them.

I increased my cell size from the previous 32 to 64, and width from 64 to 128. After I click on "Resize Tilemap", the changes are reflected on the editor!



Tilemaps can be saved and loaded here!

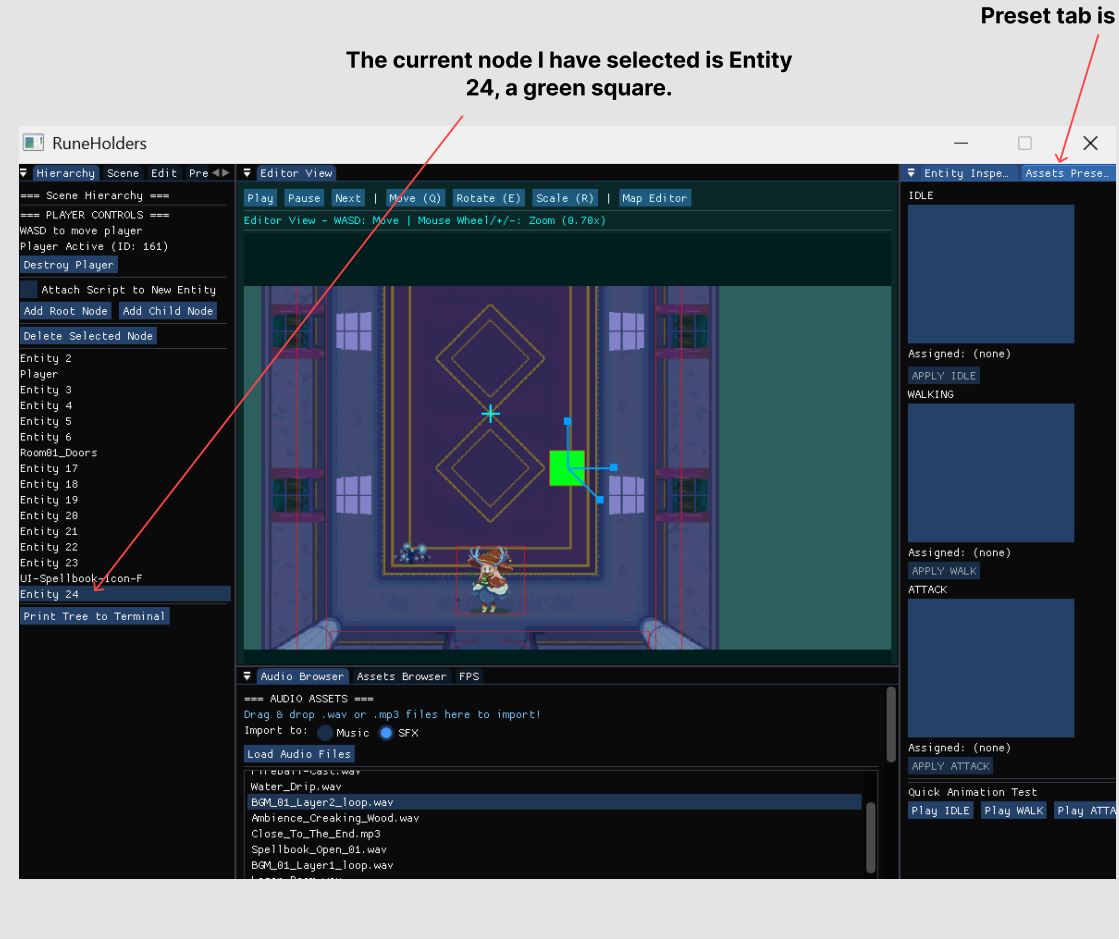
Additionally, each layer of the tilemap is classified as "Walkable" or "Obstacle"



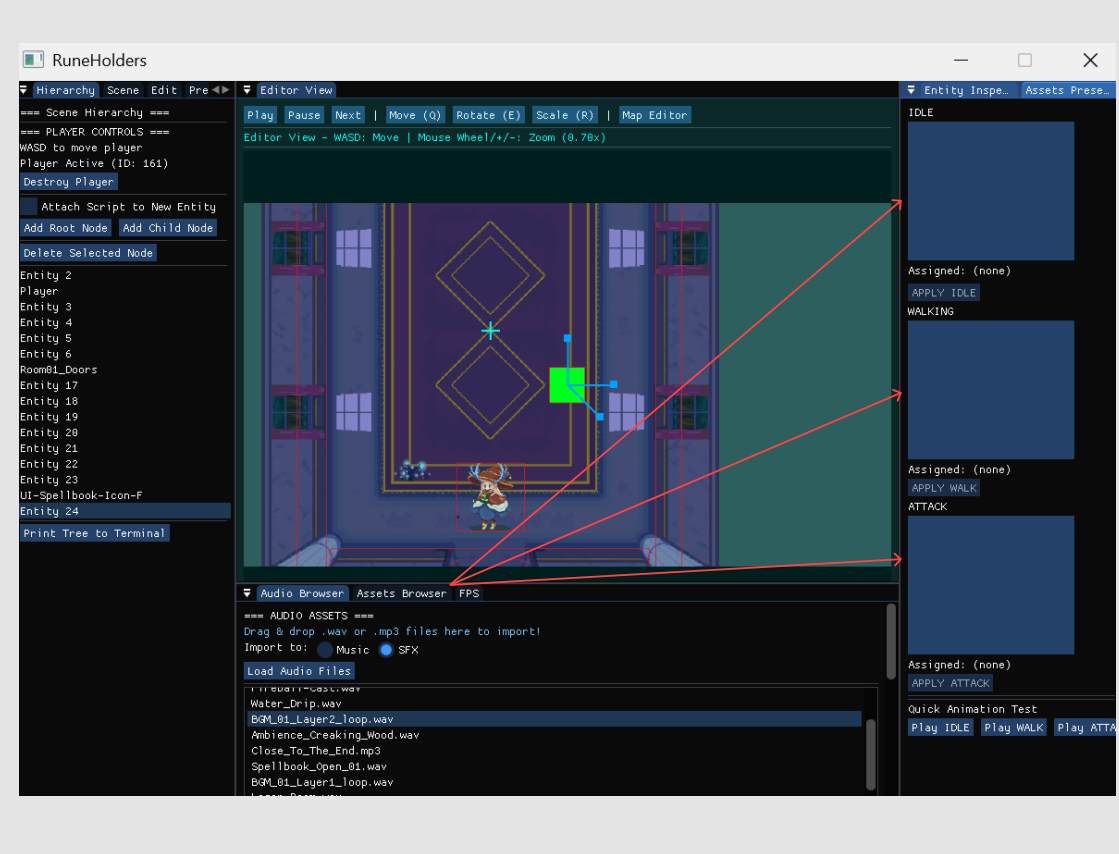
Animation

To assign a sprite to this node/entity and animate it, first, ensure that the Assets Preset tab is selected

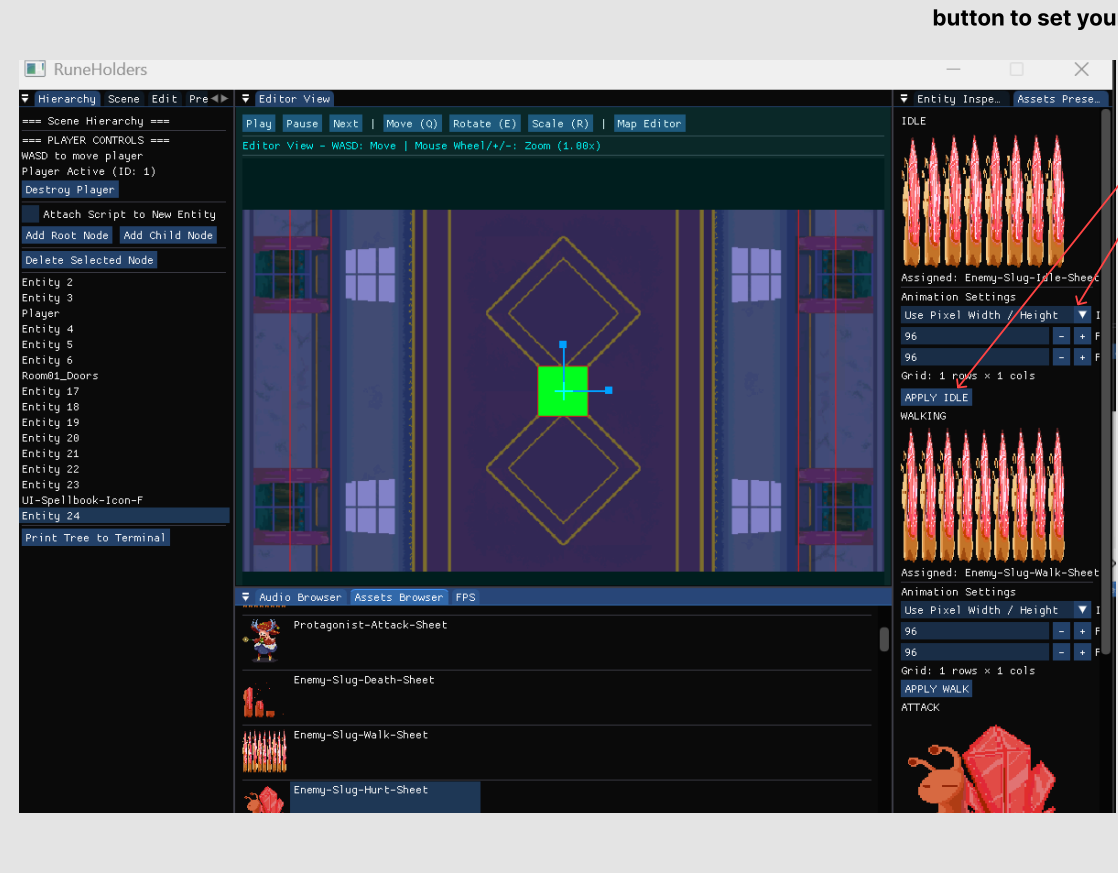
The current node I have selected is Entity 24, a green square.

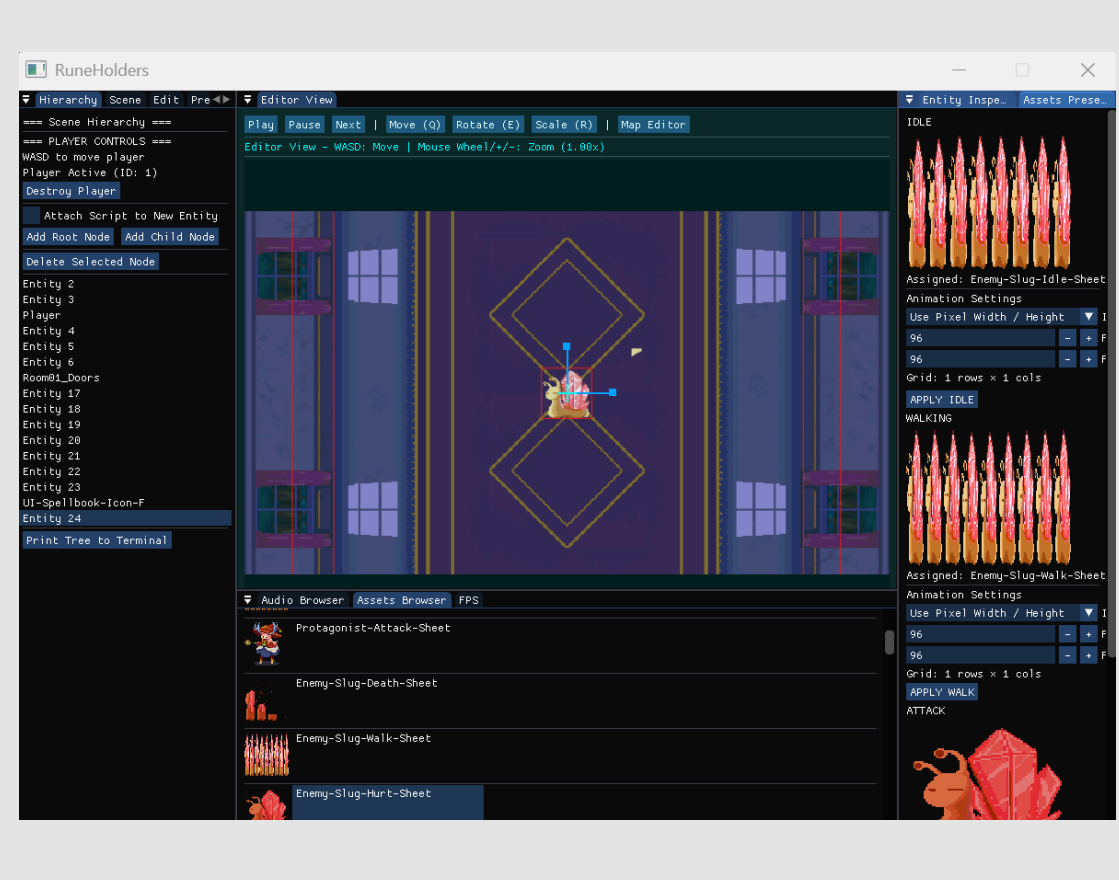


Drag and drop a texture from the "Assets Browser" into each of these panels



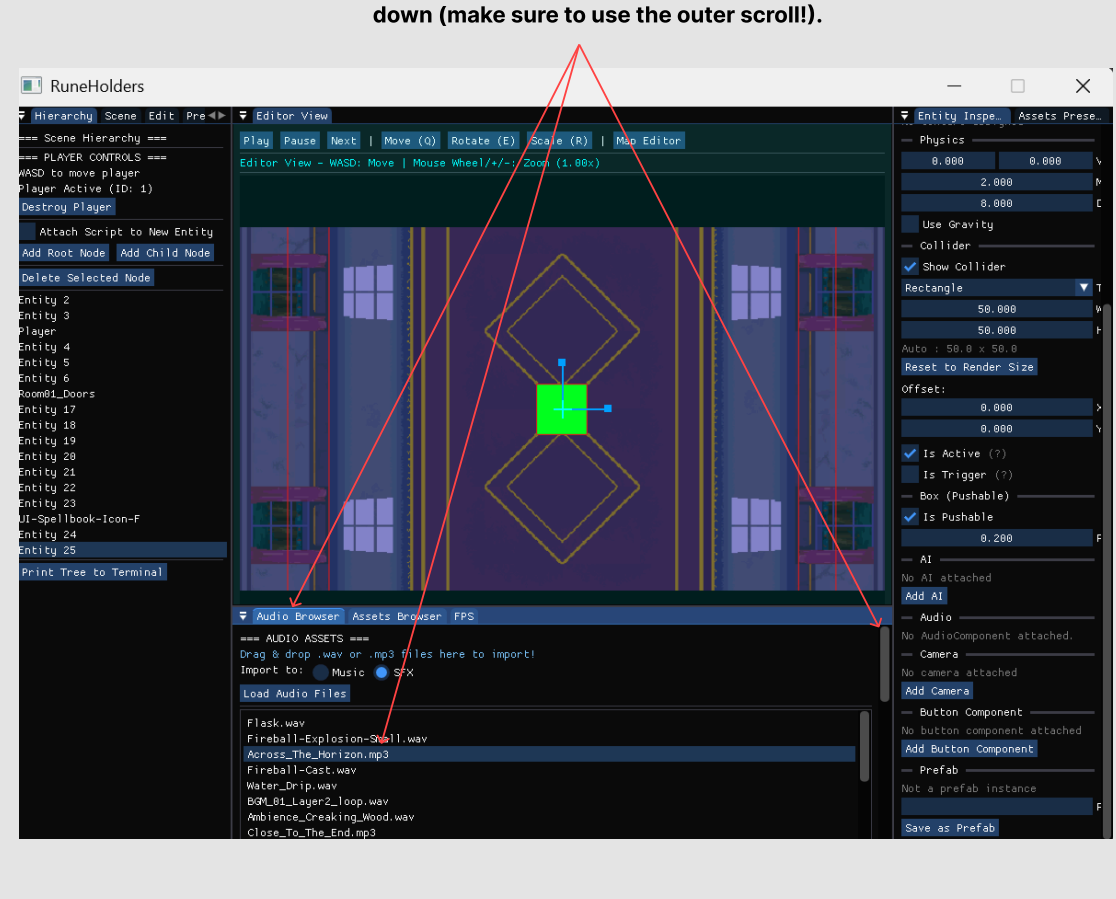
Once each texture is applied, you may modify changes to the animation settings here and use the corresponding "Apply" button to set your changes!



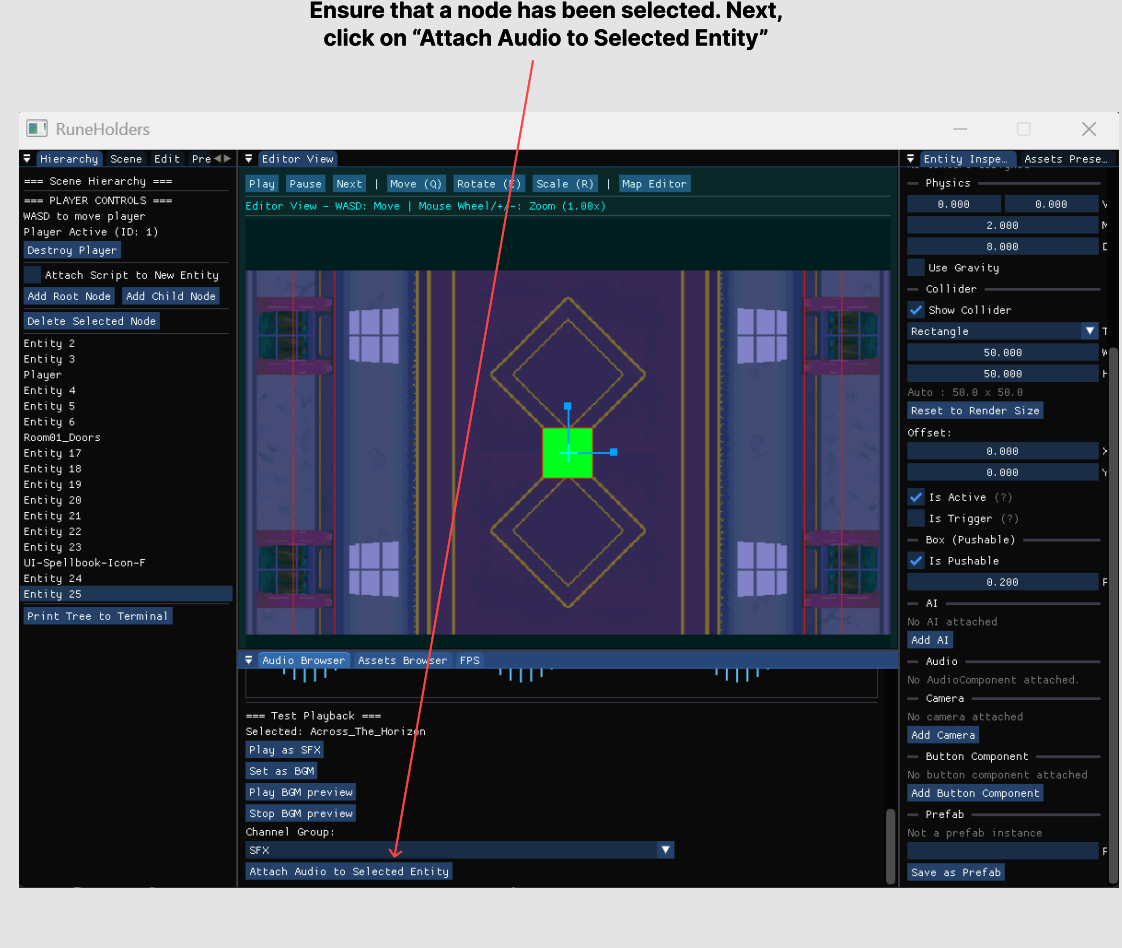


Sound

Each node can emit sound. First, navigate to the Audio Browser, pick a sound to play from the Audio Files and scroll all the way down (make sure to use the outer scroll!).



Ensure that a node has been selected. Next, click on "Attach Audio to Selected Entity"



Under the "Audio Component" tab, more information/tabs will proliferate underneath. These are audio settings to be modified.
